Clinician Notes

Chronological record / Oldest to newest

208 note entries from Fred Hutch and UW Medicine, Optum, and Overlake. Includes progress, consult, procedure, telephone, and other clinical notes present in the MyChart exports.

Notes follow their documented timestamps. Where a note has no timestamp, its encounter date is used when available. Note wording comes from the source. Headings and line breaks are formatted for reading.

January 2024

Jocelyn P, MA - 01/10/2024 10:35 AM PST

Optum / Progress Notes / MyChart DOC0034

Formatting of this note might be different from the original.

Modified evaluation performed based on CDC protocols for COVID19.

Review of Systems
Constitutional: Positive for fever. Negative for activity change, appetite change, chills and fatigue.
HENT: Positive for sore throat. Negative for congestion, ear pain, rhinorrhea and sinus pain.
Eyes: Negative.
Respiratory: Negative for apnea, cough, chest tightness, shortness of breath and wheezing.
Cardiovascular: Negative for chest pain, palpitations and leg swelling.
Gastrointestinal: Negative for abdominal pain, constipation, diarrhea, nausea and vomiting.
Endocrine: Negative. Negative for polyuria.

Genitourinary: Negative for dysuria, enuresis, flank pain, frequency, urgency and vaginal pain.
Musculoskeletal: Negative for arthralgias, back pain and neck pain.
Skin: Negative for pallor, rash and wound.
Neurological: Negative for syncope, weakness, light-headedness and headaches.
Hematological: Does not bruise/bleed easily.
Psychiatric/Behavioral: Negative for agitation, behavioral problems, confusion and sleep disturbance.

OBJECTIVE

BP 100/60 (Arm: RIGHT, Position: SITTING, Cuff Size: ADULT) | Pulse 72 | Temp 97.2 °F (36.2 °C) (Temporal) | Wt 130 lb 3.2 oz (59.1 kg) | LMP (LMP Unknown) | BMI 21.50 kg/m²

Physical Exam

Vitals and nursing note reviewed.
Constitutional:
Appearance: Normal appearance.
HENT:
Head: Normocephalic and atraumatic.
Right Ear: Tympanic membrane and ear canal normal.
Left Ear: Tympanic membrane and ear canal normal.
Nose: Nose normal.

Mouth/Throat:
Mouth: Mucous membranes are moist.
Eyes:
Conjunctiva/sclera: Conjunctivae normal.
Pupils: Pupils are equal, round, and reactive to light.
Cardiovascular:
Rate and Rhythm: Normal rate and regular rhythm.
Pulses: Normal pulses.

Heart
sounds: Normal heart sounds.
Pulmonary:
Effort: Pulmonary effort is normal.
Breath sounds: Normal breath sounds. No wheezing or rales.
Abdominal:
General: Abdomen is flat. Bowel sounds are normal.
Palpations: There is no mass.

Tenderness: There is no rebound.
Hernia: No hernia is present.
Musculoskeletal:
General: Normal range of motion.
Cervical back: Normal range of motion and neck supple.
Skin:
General: Skin is warm and dry.
Coloration: Skin is not jaundiced.

Findings: No bruising or lesion.
Neurological:
General: No focal deficit present.
Mental Status: She is alert and oriented to person, place, and time.
Cranial Nerves: No cranial nerve deficit.
Gait: Gait normal.
Psychiatric:
Mood and Affect: Mood normal.

Behavior: Behavior normal.

ASSESSMENT and PLAN

(J06.9) Upper respiratory tract infection, unspecified type (primary encounter diagnosis)
Comment: stable
Plan: GROUP A STREP, NAAT, COVID-19 (POINT OF CARE)
NAAT
See Handout

(J02.0) Strep pharyngitis
Comment: monitor symptoms
Plan: Amoxicillin 500 MG capsule
Do salt water gargles

Return in 4 weeks for follow-up or sooner as needed.

- Patient reminded about the importance of annual preventative care appointments.
- Discussed with patient (and guardian/parent if applicable) with treatment recommendations, any medication information (including risk and benefits of antibiotics/medication if prescribed), strict return precautions given, and when to seek immediate medical attention. Additionally, AVS printed for patient or made available online for patient on MyChart unless patient declined.
- The concerns and questions of the patient (and guardian/parent if applicable) were addressed. The patient (and guardian/parent if applicable) verbally demonstrated understanding of and agreement with the plan.

Optum / Progress Notes / MyChart DOC0033

Formatting of this note might be different from the original.

Modified evaluation performed based on CDC protocols for COVID19.

Benefits/Risks for this **OUTPATIENT / IN PERSON** visit discussed with Patient prior to scheduling, reviewed with Patient again today.

Protocols to promote social distancing measures and reduction of infection risk including hand hygiene and PPE-use were followed.

This patient is unaccompanied in the exam room. Patient was masked.

Clinical staff is masked using a surgical mask

SUBJECTIVE

Yvonne Franklin is a 44 y.o. female who presents for:

Chief Complaint

Patient presents with

• / Ear Fullness

HPI: ear wax

Patient's ears feel full and she thinks that she has ear wax and she is here for the removal.- she has this frequently and needs them cleaned

Problem list, medical/surgical history, medications, allergies, immunizations, social and family history reviewed and appropriately updated in Epic.

Patient Active Problem List

Diagnosis

• / Abdominal pain

• / Herpes simplex

• / Internal hemorrhoids

• / Migraine headache

• / Premature ventricular contractions

• / Esophageal reflux

• / Social phobia involving fear of public speaking

• / Supraventricular bigeminy

• / Tension-type headache

• / Vitamin D deficiency

• / Generalized anxiety disorder

• / Mild intermittent asthma without complication

• / Allergic rhinitis due to pollen

• / Muscle spasm of back

• / Left breast mass

• / Irritable bowel syndrome with diarrhea

• / Eosinophilic esophagitis

• / Gilbert syndrome

Health Maintenance Due

Topic / Date Due

• / IMMUNIZATION: HEPATITIS B (1 of 3 - 3-dose series) / Never done

Optum / Progress Notes / MyChart DOC0032

Formatting of this note might be different from the original.

Subjective:

Patient is a 45 y.o. female who presents for a complete physical exam. Current concerns include: endoscopy/somach issues , pre menopause?, anxiety

Concerns: see below
Diet: Healthy overall, hubby is a good chef
Exercise: Poorly, no exercise because of work
Sleep: sleeps efficiently when she does sleep between 12-6AM
Voiding: No issues with urination or BMs. No rectal bleeding

Work: New job 1.5 years ago - it's worse than her last one, no work/life balance, stressful. Working around the clock, works 8AM-6PM, then works again at night from 8PM- midnight. She's burned out. Works on the weekend. Has made her more anxious
Household: Lives with husband and 2 kids
EtOH: 1 glass of wine daily - it helps her relax
Tobacco: None
Drug: None

Menstruation: no menses on Mirena IUD
Sexually activity / contraception: Mirena IUD - placed in 2017 (needing replacement 2025)

Immunizations:
Pneumonia vaccine: PCV20 - declining
TdaP vaccine: 11/15/16
Flu vaccine: n/a, not currently the flu season
Hepatitis B vaccine: declining
Shingrix: n/a
COVID vaccines: Declining new COVID shot
RSV vaccine: n/a

Screening:

- last pap 5/26/21 -NILM, HPV neg
- last mammogram and ultrasound 12/29/21 - recommended short interval follow-up ultrasound 6mos for left breast (Evergreen). Will make an appointment for mammogram
- last colonoscopy 10/18/21 - cleared x 5 yrs (Dr. Selinger)

Medications as noted below. Working well without side effects.

Had breast reduction 2 years ago
Path was normal.
Will schedule mammogram at Evergreen

Perimenopause.

Sometimes forgetful but she realizes that this is likely stress related.
No other symptoms - including no hot flashes, night sweats, or sleep issues

GAD.
Had been on citalopram 20mg - had decreased libido but symptoms were tolerable. She never did bump up to 30mg daily dose.
She stopped taking citalopram last year
She has a constant internal fight on whether to take medication or not, so she stopped.
She realizes now that she needs to stop fighting it and restart her medication.
She is open to doing that today
Had also been on alprazolam 0.5mg as needed in the past - last refilled on 2/15/23 - #15, no refill
We reviewed the potential for addiction and abuse with alprazolam. She expressed understanding

Prior treatment:
Sertraline 100mg- caused sedation, felt more anxious and uneasy. 50mg was not effective

Mild intermittent asthma.
Albuterol HFA as needed - rarely needs it.
Does not recall the last time she used her inhaler, had used it max once a year when she used it. The last time she used it was at least > 1 year ago
Needing refill because her current inhaler is expired
Declining PCV20 today

Migraines.

Controlled mostly with propranolol 10mg daily. Takes Sumatriptan as needed - works when she takes it immediately.
No increase in migraines despite increased stressors

Fear of public speaking. Propranolol 10mg daily is helping.

HSV I. Valacyclovir as needed, works well as needed

Abdominal cramping / irritable bowel syndrome.
Dicyclomine as needed - has not needed to take it.
Needing refill because hers are likely expired
EGD / colonoscopy 10/18/21 (Dr. Selinger)

GERD. Findings seen on EGD.
Has not been using omeprazole because she's not having issues. Will let me know if she needs refill

Dysphagia.
Wonders if she needs another endoscopy -
For the last 3 months, she has noted:
(1) a tightening in her throat after eating. Not extreme, stays for a few minutes and then resolves. Does not feel her airway is closing.
(2) Feels like things get stuck more often after swallowing, despite cutting up her food well

Vit D def.

Has not been taking Vit D

GAD-7 --- Anxiety --- last 2 weeks

Anxiety is likely if:

(A)at least 1 of the f
irst 2 items(GAD-2) is present **and** the Sum of the first 2 items is > 3
(B) at least a score of 5 points or greater for all items is present.
The overall *__Anxiety Severity__* is the **sum** of ratings of all the 7 items

PATIENT'S TOTALS ***6 *: *15* **

Cut-offs for severity of Anxiety: 3 : 5

**GAD-2 score = *6 *
>3 **pts suggests anxiety

Anxiety Severity = *15*

| **0 - 4** | Generalized Anxiety
Disorder: None | No treatment recommended (or Continue current maintenance treatment) |

5 - 9 / Mild / Counseling (or Consider adjusting current treatment)

10 - 14 / Moderate / Medication and/or Counseling; evaluate for other anxiety disorders such as panic disorder, or PTSD

15 - 21 / Severe / Medication, Counseling, evaluate for other anxiety disorders such as panic disorder, or PTSD; consider referral to Psychiatry

5/26/2021 / 2/15/2023 / 5/26/2023 / 7/17/2024

GAD-7

1.) Feeling nervous, anxious or on edge / **3 - Nearly every day[image:Abnormal]** / **3 - Nearly every day[image:Abnormal]** / 1 - Several days / **3 - Nearly every day[image:Abnormal]**

2.) Not being able to stop or control worrying / **3 - Nearly every day[image:Abnormal]** / **3 - Nearly every day[image:Abnormal]** / 1 - Several days / **3 - Nearly every day[image:Abnormal]**

3.) Worrying too much about different things / **3 - Nearly every day[image:Abnormal]** / **3 - Nearly every day[image:Abnormal]** / 1 - Several days / 0 - Not at all

4.) Trouble relaxing / **3 - Nearly every day[image:Abnormal]** / **2 - More than half the days[image:Abnormal]** / 1 - Several days / **3 - Nearly every day[image:Abnormal]**

5.) Being so restless that it is hard to sit still / **3 - Nearly every day[image:Abnormal]** / **2 - More than half the days[image:Abnormal]** / 0 - Not at all / **3 - Nearly every day[image:Abnormal]**

6.) Becoming easily annoyed or irritable / **2 - More than half the days[image:Abnormal]** / 1 - Several days / 0 - Not at all / **3 - Nearly every day[image:Abnormal]**

7.) Feeling afraid as if something awful might happen / 0 - Not at all / 0 - Not at all / 0 - Not at all / 0 - Not at all

GAD-7 Score (0-21) / 17 / 14 / 4 / 15

If you checked any problems, how difficult have they made it for you to do your work, take care of things at home, or get along with other people? / Extremely difficult

Depression Screening Tool / More data exists

7/17/2024 / 5/26/2023

PHQ-2 Depression Screening tool

1.) Little interest or pleasure in doing things / 0 - Not at all / 0 - Not at all

2.) Feeling down, depressed, or hopeless / 0 - Not at all / 0 - Not at all

PHQ2 Total Score / 0 / 0

Review of Systems negative except as noted in HPI above

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is rec
orded by Clinical Staff. Recorded information was reviewed for accuracy and edited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

Objective:

BP 102/62 | Pulse 78 | Temp 97.5 °F (36.4 °C) | Ht 5' 5" (1.651 m) | Wt 125 lb 12.8 oz (57.1 kg) | BMI 20.93 kg/m²

Physical Exam

Vitals reviewed.
Constitutional:
General: She is not in acute distress.
HENT:
Head: Normocephalic and atraumatic.
Right Ear: Tympanic membrane, ear canal and external ear normal.
Left Ear: Tympanic membrane, ear canal and external ear normal.
Nose: Nose normal.

Mouth/Throat:
Mouth: Mucous membranes are moist.
Eyes:
Conjunctiva/sclera: Conjunctivae normal.
Pupils: Pupils are equal, round, and reactive to light.
Neck:
Thyroid: No thyroid mass, thyromegaly or thyroid tenderness.
Cardiovascular:

Rate and Rhythm: Normal rate and regular rhythm.
Heart sounds: Normal heart sounds.
Pulmonary:
Effort: Pulmonary effort is normal.
Breath sounds: Normal breath sounds.
Chest:
Breasts:
Right: Normal. No mass, nipple discharge, skin change or tenderness.

Left: Normal. No mass, nipple discharge, skin change or tenderness.
Comments: **Well-healed scars s/p breast reduction bilaterally**
Abdominal:
General: Bowel sounds are normal.
Palpations: Abdomen is soft. There is no mass.
Tenderness: There is no abdominal tenderness. There is no guarding or rebound.
Musculoskeletal:
Right lower leg: No edema.

Left lower leg: No edema.
Lymphadenopathy:
Cervical: No cervical adenopathy.
Upper Body:
Right upper body: No supraclavicular or axillary adenopathy.
Left upper body: No supraclavicular or axillary adenopathy.
Skin:
General: Skin is warm.

Capillary Refill: Capillary refill takes less than 2 seconds.
Neurological:
General: No focal deficit present.

Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:
Mood and Affect: Affect normal. Mood is anxious.
Speech: Speech normal.
Behavior: Behavior normal. Behavior is cooperative.

Thought Content: Thought content normal.
Judgment: Judgment normal.

Pelvic exam: deferred, she is up to date on pap and has no symptoms
Pap smear: up to date
Screening mammogram: will schedule
Colon cancern screening: up to date

Vaccines:

Pneumonia vaccine: PCV20 - declining
TdaP vaccine: 11/15/16
Flu vaccine: n/a, not currently the flu season
Hepatitis B vaccine: declining
Shingrix: n/a
COVID vaccines: Declining new COVID shot
RSV vaccine: n/a

- See AVS below for management / plan.
- Restart citalopram 20mg daily and as-needed alprazolam
- Follow-up appointment regarding citalopram in 2-3 months (video visit ok)
- Return to clinic 1 year for complete physical exam. Return to clinic sooner as needed.
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.
- PDMP reviewed and consistent
- Patient expressed understanding and agreement with above treatment plan.

Patient Instructions

Dear Ms.Franklin

Thank you for including me in your health care today.

Here are the diagnoses that we discussed today and what we are doing about it:

ICD-10-CM

1. / **Preventative health care** / **Z00.00**
2. / Generalized anxiety disorder / F41.1
3. / Mild intermittent asthma without complication / J45.20
4. / Irritable bowel syndrome with diarrhea / K58.0
5. / Social phobia involving fear of public speaking / F40.10
6. / Migraine without aura and without status migrainosus, not intractable / G43.009
7. / Herpes simplex / B00.9
8. / Gastroesophageal reflux disease without esophagitis / K21.9
9. / Encounter for general adult medical examination w/o abnormal findings / Z00.00
10. / Pharyngeal dysphagia / R13.13
11. / Abdominal cramping / R10.9

12. / Vitamin D deficiency / E55.9

Restart citalopram 20mg daily and as-needed alprazolam.

Follow-up appointment regarding citalopram in 2-3 months (video visit ok)

Continue current medications otherwise

For bone health- make sure to get regular weight bearing exercise, 500 mg calcium twice a day and 1,000 IU Vit D daily.
The calcium is better absorbed through dietary sources. (600 mg of calcium is about 10-12 oz of cheese, milk or yogurt. They have good lists of calcium content in foods online.) But if you aren't getting enough calcium through your diet, then getting it through a supplement is better than not getting enough.

Please make an appointment with Dr. Selinger

Please make an appointment for your mammogram.

Return to clinic 1 year for complete physical exam, sooner as needed

Prescriptions Signed In This Encounter

Medications

• / Citalopram 20 MG tablet

Sig: Take 1 tablet by mouth daily.

Dispense: 100 tablet

Refill: 0

• / ALPRAZolam 0.5 MG tablet

Sig: Take 0.5-1 tablets by mouth 2 times daily as needed for anxiety (for panic attacks). May repeat in 6-8 hours if needed. May cause sedation

Dispense: 15 tablet

Refill: 0

• / propranolol 10 MG tablet

Sig: Take 1 tablet by mouth daily.

Dispense: 100 tablet

Refill: 3

• / dicyclomine 10 MG capsule

Sig: Take 1 capsule by mouth 4 times daily as needed (colonic spasms).

Dispense: 30 capsule

Refill: 3

• / ValACYclovir 1 g tablet

Sig: 2 tablets Q12 hrs x 1 day as needed herpes outbreak

Dispense: 8 tablet

Refill: 3

• / SUMAtriptan (Imitrex) 100 MG tablet

| | | Sig: TAKE 1 TABLET BY
MOUTH AT ONSET OF HEADACHE, MAY TAKE 1 AND REPEAT IN 2 HOURS IF HEADACHE REMAINS, MAX 2 TABLETS PER 24 HOURS |

Dispense: 9 tablet

Refill: 5

• / albuterol HFA (Proventil, Ventolin, ProAir) 90 MCG/ACT inhaler

Sig: Take 2 puffs by inhalation every 4 to 6 hours as needed for wheezing or shortness of breath. Not to exceed 10 puffs/24 hours.

Dispense: 18 g

Refill: 2

May sub ProAir, Proventil or Ventolin at same directions, same refills.

Additional orders placed in this encounter

Procedures

• / CBC no diff

• / Comprehensive metabolic panel

• / Lipid

• / TSH REFLEX TO FT4

• / VIT D (12 OH VITAMIN D)

• / REFERRAL / CONSULT TO GASTROENTEROLOGY

Please contact us if you have any questions or issues about your care today, follow-up plan, or response to treatment.

Optum / Progress Notes / MyChart DOC0031

Formatting of this note might be different from the original.

Modified evaluation performed based on CDC protocols for COVID19.

The pros and cons of a video visit for providing this care was reviewed with Yvonne Franklin, and their verbal consent has been given to deliver this visit.

This **VIDEO** visit was conducted in real time, via synchronous interactive video & audio conferencing technology (Epic Video Client),
with patient located at home and, Leilani D Paras, MD located at EFMC FAMILY MEDICINE

Discussed with patient/parent: You have chosen to receive care through the use of telemedicine.
Telemedicine enables health care providers at different locations to provide safe, effective, and convenient care through the use of technology.

As with any health care service, there are risks associated with the use of telemedicine, including equipment failure, poor image resolution, and information security issues.
You also understand that I cannot physically examine you and that you may need to come to clinic to complete the assessment.

I have discussed the benefits of MyChart. Patient is already signed up for MyChart.

Patient Verifier : Yvonne Franklin, 6/17/1979
Patient is accompanied by her self in the video visit.

Do you consent to the use of telemedicine in your medical care today? Yes

Patient/parent verbally understands the risks and benefits of telemedicine as explained.
All questions regarding telemedicine answered.
Preferred phone number to contact patient is :360-201-2728

Is it okay to leave a detailed voicemail on this number? Yes

Subjective:

Yvonne Franklin is a 45 y.o. female She

Chief Complaint

Patient presents with

• / Anxiety

Follow up

HPI:

Patient is seen today via video visit for for med check on citalopram 20mg for anxiety
Due to technical difficulties, video visit was done via phone.

-Her citalopram was restarted at her last complete physical exam 7/17/24.
-She is taking 1/2 tablet daily
-She tried to take 1 tablet at night and could not sleep.
Went back to 1/2 tablet and side effects resolved.
-She feels like it's helping but she feels like she could use a little more help from the medication.
-Her husband has noted an improvement in her stress level.
-She also can feel it in her brain, feels like "it's taking over my brain." She's aware it's in her system and in her body.
-She is still hesitant to taking medications for her anxiety. She still feels like she should be able to do it without need for meds.

-Also taking alprazolam 0.5mg as needed. Last refilled on 7/17/24 - #15, no refill
She hasn't used any alprazolam since last visit.

Tolerating 10mg citalopram dose well without side effects

Problem list, medical/surgical history, medications, allergies, immunizations, social and family history reviewed and appropriately updated in Epic.

Review of Systems negative except as noted in HPI above

Reviewed and updated this visit by provider:
Allergies | Meds | Problems |

Objective:

Patient Reported Vitals (Extended)

Weight: 126 lb (57.2 kg)

Limited Exam via patient's / Parent's video

Physical Exam

Constitutional:
General: She is not in acute distress.
Neurological:
Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:
Mood and Affect: Mood is anxious **(mild)**.
Speech: Speech normal.
Behavior: Behavior normal. Behavior is not aggressive, withdrawn, hyperactive or combative. Behavior is cooperative.

Thought Content: Thought content normal.
Judgment: Judgment normal.

Assessment and Plan:

ICD-10-CM

1. / **Generalized anxiety disorder** / **F41.1** / **citalopram (CeleXA) 20 MG tab**

- See AVS. This is made available online for patient on MyChart since today's visit was a video visit.

-Increase citalopram to 20mg daily.
-Continue rare use of alprazolam as needed.
-Try switching citalopram to the AM x 1-2 weeks and see if sleep gets better.

- If you cannot tolerate the 20mg dose, please send me a MyChart message and we will try 10mg tablet @ 1.5 tablets daily (15mg dose) to see if you can tolerate it.
- Monitor symptoms.
- Make follow-up appointment 1 month (video visit ok)
- If you're doing well, then message me via MyChart and you can cancel the follow-up appointment in 1 month
- Return to clinic / call sooner if symptoms increase/change
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.
- Patient expressed understanding and agreement with above treatment plan.

Formatting of this note might be different from the original.
This **VIDEO** visit was conducted in real time, via synchronous interactive video & audio conferencing technology, utilizing the HIPAA compliant MyChart Epic Video Client Platform.
Patient is located in their home/work/car in the state of Washington.
Leilani D Paras, MD is located in the EFMC FAMILY MEDICINE office and is licensed in the state of Washington.

Discussed with patient/parent: You have chosen to receive care through the use of telemedicine.
Telemedicine enables health care providers at different locations to provide safe, effective, and convenient care through the use of technology.
As with any health care service, there are risks associated with the use of telemedicine, including equipment failure, poor image resolution, and information security issues.
You also understand that I cannot physically examine you and that you may need to come to clinic to complete the assessment.

I have discussed the benefits of MyChart. Patient is already signed up for MyChart.

Patient Verifier : Yvonne Franklin, 6/17/1979
Patient is accompanied by herself in the video visit.

Do you consent to the use of telemedicine in your medical care today? Yes

Patient/parent verbally understands the risks and benefits of telemedicine as explained.
All questions regarding telemedicine answered.

Preferred phone number to contact patient is :360-201-2728

Is it okay to leave a detailed voicemail on this number? Yes

Yvonne is a 45 y.o. female who presents for:

Chief Complaint

Patient presents with

• / Medication Mgmt

HPI:

Yvonne is seen via video visit for follow-up anxiety
She was last seen 10/11/24 for this.

At that appointment, we had her:

- she noted an improvement of her symptoms at citalopram 10mg daily
- we had her increase citalopram to 20mg daily
- try switching her citalopram to the morning, since it caused insomnia when she took it at night
- continue use of alprazolam as needed

Since last appointment:

- Her anxiety has improved with 20mg daily dosing. Better overall, doesn't have anxiety 24/7.
- She feels like this is a good dose for her.
- No side effects. No insomnia since she switched to AM dosing
- Use of alprazolam? Has not needed to take it. (Alprazolam 0.5mg - last refilled 7/17/24 - #15, no refill)

Chief Complaint

Patient presents with

• / Physical

| | | *Patient is here for a Annual Physical Exam patient is fasting*
Patient see eye dr every year or two
Patient gets exercises every week |

Just got back from 2 week trip from Hawaii

Concerns: see below
Diet: Healthy overall, hubby is a good chef
Exercise: No exercise usually because of work. But she exercised every day while in Hawaii
Sleep: sleeps efficiently when she does sleep between 12-6AM
Voiding: Feeling constantly bloated, feels like her gut is out of wack. No issues with urination or BMs. No rectal bleeding

Work: Still at previous job - no work/life balance, stressful. Working around the clock. Interviewing for new job.
Household: Lives with husband and 2 kids
EtOH: 1-2 glasses of wine daily - it helps her relax. We discussed keeping it down to 1 drink/day
Tobacco: None
Drug: None

Menstruation: no menses on Mirena IUD until recently, has occasional spotting
Sexually activity / contraception: Mirena IUD - placed in 2017 (needing replacement 2025) - will make an appointment for removal and re-insertion.

Immunizations: These were reviewed with patient today
Pneumonia vaccine: PCV20 - declining
TdaP vaccine: 11/15/16
Flu vaccine: n/a, not currently the flu season
Hepatitis B vaccine: declining
Shingrix: n/a
COVID vaccines: Declining new COVID shot
RSV vaccine: n/a

Screening:

- last pap 5/26/21 -NILM, HPV neg (due 2026)

- last mammogram and ultrasound 4/10/25 - neg

- last colonoscopy 10/18/21 - cleared x 5 yrs (Dr. Selinger)

GAD.
-Last seen for this on 11/15/24.
-At that time, her increased citalopram dose (20mg) was helping
-No side effects. No insomnia since switching to AM dosing
-No longer taking her citalopram. She was traveling a lot for a couple of months and forgot to take it with her. But would like to restart. She thinks it would help with the upcoming transition and with the drinking
-Alprazolam use - sparingly. Worked well when she used it.
-Alprazolam 0.5mg - last refilled 7/17/24 - #15, no refill
-Prior treatment:

-Sertraline 100mg- caused sedation, felt more anxious and uneasy. 50mg was not effective

Mild intermittent asthma.
-Albuterol HFA as needed - rarely needs it.
-Has used it 3 times in the last year.
-Not needing refill, will let me know if/when she needs refill
-Declining PCV20 today

Migraines.

-Controlled mostly with propranolol 10mg daily.
-Takes Sumatriptan as needed - works when she takes it immediately.
-Has not had any migraines for a long time. Not needing triptan refill at this time, will let me know if/when she does

Fear of public speaking. Propranolol 10mg daily is helping.

HSV I. Valacyclovir as needed, works well as needed

Vit D def.

-not taking Vit D
-she spent 2 weeks in HI - outside x 8 hrs/day, wore sunscreen

Abdominal cramping / irritable bowel syndrome.
-Dicyclomine as needed - has not needed to take it.
-EGD / colonoscopy 10/18/21 (Dr. Selinger)

GERD.
-Findings seen on EGD.
-Has not been using omeprazole, will let me know if/when she needs refill

Dysphagia.
-Had increased symptoms last year and was referred back to GI.
-Didn't get a chance to see GI last year, would like to re-referral
-No episodes of food getting stuck. Symptoms may be better, definitely not worse.

Health Maintenance items addressed during this visit:

All Health care Maintenance items pended for provider review. See orders for items that patient agreed to perform.

Health Care Maintenance Items:

The following healthcare maintenance items were reviewed regarding risks / benefits and were either accepted or declined.

For those accepted, the appropriate lab tests were ordered, appointments made and / or phone numbers given for patient to follow up.
For those that were declined, the pt declined despite fully understanding that by foregoing this (these) procedure(s), they increase their risk of undiagnosed cancer or disease and a potential missed opportunity for early detection, prevention or treatment.
The patient admits that they understand that this is against medical advice of their doctor and state that they freely choose with full informed consent to not participate in this screening / testing process.

There are no preventive care reminders to display for this patient.

Last Colonoscopy / Diabetic Eye Exam

This patient has no relevant Health Maintenance data.

Last Diabetic Eye Exam

This patient has no relevant Health Maintenance data.

Social History

Substance and Sexual Activity

Alcohol Use / 1-2 glasses of wine each night.

Patient does not have a diagnosis of hypertension on their problem list.

?- See AVS below for management / plan.

- Return to clinic 1 year for complete physical exam. Return to clinic sooner as needed.
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.

- PDMP reviewed and consistent

- Patient expressed understanding and agreement with above treatment plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

Patient Instructions

Dear Ms.Franklin

Thank you for including me in your health care today.

Here are the diagnoses that we discussed today and what we are doing about it:

ICD-10-CM

1. / **Preventative health care** / **Z00.00**

2. / Generalized anxiety disorder / F41.1

3. / Mild intermittent asthma without complication / J45.20

4. / Migraine without aura and without status migrainosus, not intractable / G43.009

5. / Social phobia involving fear of public speaking / F40.10

6. / Herpes simplex / B00.9

7. / Vitamin D deficiency / E55.9

8. / Irritable bowel syndrome with diarrhea / K58.0

9. / Gastroesophageal reflux disease without esophagitis / K21.9

10. / Abdominal cramping / R10.9

11. / Other acute gastritis without hemorrhage / K29.00

12. / Generalized anxiety disorder / F41.1

13. / Oropharyngeal dysphagia / R13.12

Restart citalopram 20mg - 1/2 tablet daily for 1 wk then increase to 1 tablet daily thereafter. Please send a MYChart message in 1 month to let me know how you're doing.

Continue current medications

Please make an appointment with Dr. Selinger

We're checking labs and will contact you via MyChart

Please make an appointment for your Mirena IUD - removal and re-insertion of new one.

Return to clinic 1 year for complete physical exam, sooner as needed

This patient is unaccompanied in the exam room.

Subjective:

Yvonne is a 46 y.o. female who presents for:

Chief Complaint

Patient presents with

• / Contraception

IUD consult

HPI:

46-year-old female presents today for evaluation of IUD removal and reinsertion.
She does not check her string at home. Has not had a speculum or pelvic exam within the last year.
She had her Mirena IUD placed in 2017. She is due for replacement.
Denies complications with initial placement of IUD.
Currently have occasional breakthrough bleeding, but otherwise amenorrheic with use of Mirena IUD.
Would like to continue hormonal IUD for contraceptive management.

-- Discussed with Patient and made AVS available through MyChart with treatment recommendations, any medication information (including risk and benefits of antibiotics/medication if prescribed), strict return precautions given, and when to seek immediate medical attention.

-- The concerns and questions of the Patient were addressed. The Patient verbally demonstrated understanding of and agreement with the plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Vi Tran, MD, who also personally confirmed the chief complaint with patient and completed HPI.

E/M code was selected based on 20 minutes spent on the date of encounter reviewing pertinent history and previous diagnostics, performing medically appropriate examination and evaluation, ordering diagnostic tests and/or medications, counseling and education to patient/family/caregiver. This excludes separately reportable services.

For G2211, Patient chronically managed by me for ongoing care related to this patient's single, serious, or complex condition; I will follow/have followed the patient longitudinally for this condition

Chief Complaint

Patient presents with

- / IUD Removal
- / IUD Insertion

HPI:

46-year-old female presents today for scheduled IUD removal and insertion. Contraceptive consult completed 8/14/2025. Patient has no new concerns today. Consent signed by patient.
Problem List
Current Medications

Reviewed and updated this visit by provider:

Review of Systems
Constitutional: Negative.
Genitourinary: Negative.

Objective:

Blood pressure 102/64, pulse 68, temperature 98 °F (36.7 °C), temperature source Oral, resp. rate 16, height 5' 5.25" (1.657 m), weight 126 lb (57.2 kg).

Physical Exam

Constitutional:
Appearance: Normal appearance.
HENT:
Head: Normocephalic and atraumatic.
Cardiovascular:
Rate and Rhythm: Normal rate.
Pulmonary:
Effort: Pulmonary effort is normal.

Genitourinary:
General: Normal vulva.
Vagina: Normal.
Cervix: Normal.
Uterus: Normal.
Adnexa: Right adnexa normal and left adnexa normal.
Comments: **IUD string in place**
Neurological:

Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:
Mood and Affect: Mood normal.
Behavior: Behavior normal.

Procedure: IUD removal and insertion
IUD type: Mirena

The patient was positioned in the lithotomy position.
The speculum was inserted to visualize the cervix. IUD string visible outside the cervical os.
Ring forceps were used to remove the IUD in its entirety.
The cervix was cleansed with an antiseptic solution.
A tenaculum was applied to the cervix for stabilization.

Uterine sounding was performed to measure the depth of the uterine cavity: 6cm.
The IUD was loaded into the insertion device according to the manufacturer's instructions.
The IUD was inserted through the cervical canal and placed at the fundus of the uterus.

The strings were trimmed to approximately 3 cm outside the cervical os.
The tenaculum and speculum were removed.

Assessment and Plan:

1. Encounter for IUD removal and reinsertion (Primary)

Patient advised on expected cramping and spotting.
Educated on signs of potential complications (e.g., severe pain, heavy bleeding, signs of infection) and instructed to contact the office if these occur.
Follow-up as needed

- INSERT INTRAUTERINE DEVICE
- levonorgestrel (Mirena) IUD 52 mg
- levonorgestrel (Mirena) 52 MG IUD; 1 Intra Uterine Device by intrauterine route -. Inserted in-clinic. Leave on medication list for interaction checking
- REMOVE INTRAUTERINE DEVICE

-- Discussed with Patient and made AVS available through MyChart with treatment recommendations, any medication information (including risk and benefits of antibiotics/medication if prescribed), strict return precautions given, and when to seek immediate medical attention.

-- The concerns and questions of the Patient were addressed. The Patient verbally demonstrated understanding of and agreement with the plan.

Lillian, RN BSN -- Call Assist RN/WIC RN

Provider: **Patient would like to talk with provider. Patient would like to know if this bleeding is normal?**
Menstrual cycle is every 21 days and last 7 days.
Use to have IUD for 8 years
Got a new IUD in August 2025
With last IUD had a little spotting and then no periods
Patient currently has levonorgestrel IUD
Starting to get low energy and concerned iron is low

Patient said body is acting different from the same hormonal IUD she had for 8 years

Route to RN pool with orders. Thank you!

Situation: IUD questions

Background:

Patient calling
Patient identified by name and date of birth
Phone number confirmed

Assessment:

Menstrual cycle is every 21 days and last 7 days.
Use to have IUD for 8 years
Got a new IUD in 2025

With last IUD had a little spotting and then no periods
Patient currently has levonorgestrel
Starting to get low energy and concerned iron is low
Patient is currently on cycle this day 3
Soaking tampons needing about 5 pads throughout the day
Has little stomach discomfort

Recommendation: Disposition: Message sent to provider
Patient to seek emergent care if Severe vaginal bleeding (e.g., soaking 2 pads or tampons per hour and present 2 or more hours; 1 menstrual cup every 2 hours)
Patient verbalized understanding and agrees to plan.

Protocol Used: Contraception - IUD Symptoms and Questions (Adult)
Disposition for Call (Nurse Override): Discuss with PCP and Callback by Nurse Today
Override Reason: Caller refused suggested disposition
Override Notes: patient would like to speak with provider
Protocol-Based Disposition: Go to Office Now

Positive Triage Question:
* Moderate vaginal bleeding (e.g., soaking 1 pad or tampon per hour and present > 6 hours; 1 menstrual cup

every 6 hours)

Care Advice Discussed:
* The Hormonal IUD - Side Effects

- It is common for your menstrual periods to completely go away or become lighter and less frequent after placement of a hormone releasing IUD.
- Changes in Vaginal Bleeding: About 1 in 4 women will have bleeding or spotting between menstrual periods during the first 6 months. Most women notice that their menstrual periods become lighter after getting a hormonal IUD.
- Missed Menstrual Periods: About 2 out of 10 women stop having periods having this type of IUD for 1 year. The medical term for this is amenorrhea. When the IUD is removed, your menstrual periods will come back.
- Other Symptoms: Some women have mild breast tenderness, acne, and headache. This is because a small amount of the hormone from the IUD gets into the blood stream.

Negative Triage Questions:
* Shock suspected (e.g., cold/pale/clammy skin, too weak to stand, low BP, rapid pulse)
* Sounds like a life-threatening emergency to the triager
* Severe abdominal pain (e.g., excruciating) and present > 1 hour
* Severe vaginal bleeding (e.g., soaking 2 pads or tampons per hour and present 2 or more hours; 1 menstrual cup every 2 hours)
* Patient sounds very sick or weak to the triager

Reference *ClearTriage - Adult Telephone Protocols
, Office Version by David A. Thompson, MD, FACEP & Pediatric Telephone Protocols by Barton D. Schmitt.*

Optum / Miscellaneous Notes / MyChart DOC0024

Formatting of this note might be different from the original.
Please tell her that it is possible for women to have menses like she's having after an IUD, even though this is not what she experienced last time.

I do agree that low energy could be due to low iron, since she's having more menses now. Please recommend she return to clinic for eval - want to check her IUD strings, make sure they're in place and also do labs.

Please assist in scheduling her for OV - ok to fit her in if needed. Please let me know if questions. Thanks

Yvonne Franklin has provided verbal consent for the use of DAX during today's office visit. Three identifiers (Yvonne Franklin, 6/17/1979, 360-201-2728) have been used to identify the patient.

Subjective:

This patient is unaccompanied in the exam room.

Yvonne is a 46 y.o. female who presents for:

Chief Complaint

Patient presents with

• / Bleeding

*Patient stated been having issues with her IUD with lots of bleeding, every 21 days. *

History of Present Illness
46-year-old female here for IUD follow-up.

IUD Follow-up

- IUD inserted end of August 2025
- Menstrual cycles every 21 days, lasting 7 days, with heavy flow requiring tampons and pads changed multiple times daily
- Consistent for 5 months
- Did not have these issues with previous IUD

Fatigue

- Reports significant fatigue despite good sleep hygiene and no alcohol
- Suspects iron or vitamin D deficiency
- History of anemia and vitamin D deficiency
- Resumed vitamin D supplements yesterday
- Currently on day 5 of menstrual cycle
- No hot flashes or night sweats

Social History

- Alcohol: Abstinent
- Sleep: Good, no issues

GYNECOLOGICAL HISTORY

- Cycle Length: 21 days

- Duration: 7 days

- Frequency and Flow: Heavy, tampons and pads changed multiple times daily

7/18/2025

Psychiatric:
Mood and Affect: Mood normal.

Behavior: Behavior normal.
Thought Content: Thought content normal.
Judgment: Judgment normal.

Assessment/Plan:

ICD-10-CM

1. / **Menometrorrhagia** / **N92.1** / **TSH REFLEX TO FT4**

HEMOGRAM (CBC NO DIFF)

FERRITIN

VITAMIN B12 (LAB)

IRON PROFILE

US PELVIS COMPLETE WITH TRANSVAGINAL

ESTROGENS, TOTAL IA

FSH

2. / Other fatigue / R53.83 / TSH REFLEX TO FT4

HEMOGRAM (CBC NO DIFF)

FERRITIN

VITAMIN B12 (LAB)

IRON PROFILE

3. / Vitamin D deficiency / E55.9 / 25 OH VITAMIN D

Assessment & Plan

Menometrorrhagia:

- Periods every 21 days for 7 days with heavy flow since IUD insertion in August 2025. Reports low energy and fatigue.
- Order labs: CBC, iron, ferritin, B12, TSH, reflex to free T4, vitamin D.
- Conduct ultrasound for IUD placement and uterine abnormalities.
- Consider low-dose OCP if results are normal.
- Discussed that these symptoms can occur with IUDs. Oftentimes, they resolve but may take 6-8 months.

Fatigue:

- Significant fatigue despite adequate sleep and life

style improvements.

- Order labs: iron, ferritin, B12, CBC, TSH, reflex to free T4.

Vitamin D deficiency:

- History of vitamin D deficiency, taking 5000 IU daily x 2 days
- Check vitamin D levels for further supplementation.
- Continue current vitamin D regimen until results available.

Follow-up
-Management per results
-Return to clinic if symptoms increase/change. Return precautions given
-Patient expressed understanding and agreement with above treatment plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

Voice recognition technology may have been employed in the creation of this record.

E/M code was selected based on 33 minutes spent on the date of encounter reviewing pertinent history and previous diagnostics, performing medically appropriate examination and evaluation, ordering diagnostic tests and/or medications, counseling and education to patient/family/caregiver. This is excludes activities performed by clinical staff.

For G2211, Patient chronically managed by me for ongoing care related to this patient's single, serious, or complex condition; I will follow/have followed the patient longitudinally for this condition

Patient Instructions

Dear Ms.Franklin

Thank you for including me in your health care today.

Here are the diagnoses that we discussed today and what we are doing about it:

ICD-10-CM

1. / **Menometrorrhagia** / **N92.1**

2. / Other fatigue / R53.83

3. / Vitamin D deficiency / E55.9

We're checking labs and will contact you via MyChart message with results

Please schedule your pelvic ultrasound at:

Rayus Radiology

1310 116th Ave NE, Suite E

Bellevue, WA 98004

Scheduling 855-643-7226

Phone 425-637-9729

Please let me know if you do not hear back from me about 7-10 days after getting your imaging. I'll need to call them to get your results.

We'll discuss further management based on results.

No new prescriptions were ordered during this visit.

Additional orders placed in this encounter

Chief Complaint

Patient presents with

• / Back Pain

| | | *Started 2 weeks ago pian started to developed. *

History of Present Illness:

History of Present Illness
A 46-year-old female presents with right upper back pain following a traumatic event.

Right Upper Back Pain

- Three weeks ago, she choked on a supplement pill and her husband applied forceful pressure to her right upper back and rib area (back blows) to help her dislodge the food
- No immediate pain was noted.
- Two weeks ago, she developed dull, constant pain below the right scapula, making breathing difficult and interfering with daily activities.
- Pain is localized to the right side, rated 5/10 at baseline, increasing to 8-9/10 with activities like sneezing or dishwashing.
- Sneezing triggers sharp exacerbations; deep breathing, coughing, and certain movements worsen discomfort.
- No numbness, tingling, weakness, cold symptoms, fevers, or chills. No dyspnea, no palpitations, no chest pain.
- Skiing and running during her trip may have further irritated the area.
- Ibuprofen and Tylenol provide partial relief.
- Previously used hydrocodone for pain management.

Uses alprazolam as needed for anxiety

REFERRAL / CONSULT TO PHYSICAL THERAPY

HYDROcodone-acetaminophen 5-325 MG tablet tab

2. / Pain aggravated by coughing and deep breathing / R52 / XR RIBS RIGHT

R05.9 / XR CHEST 2V

PULSE OXIMETRY REST-SNGL-BACK OFFICE

HYDROcodone-acetaminophen 5-325 MG tablet tab

Assessment & Plan

Right upper back pain:

- Constant dull pain below right scapula, worsened by sneezing, washing dishes, deep breathing, and full arm extension. No numbness, tingling, weakness, cold symptoms, fevers, or chills.
- Tenderness and spasm in upper trapezius muscle. Rhomboids normal and non-tender. No pain with palpation of thoracic spine, lumbar area, or right shoulder. Pain present only at full range of arm motion.
- Ordered chest x-ray and pulse oximetry to rule out fracture and assess lung function. Await x-ray results before initiating physical therapy. If x-ray is negative, pain likely due to trauma-related irritation.
- Prescribe hydrocodone with Tylenol for severe pain, not to exceed 4000 mg Tylenol per day. Continue ibuprofen as needed. Take all medications with food.
- Refer to physical therapy if x-ray is negative. Hold physical therapy if fracture is detected.
- Return to clinic or ER if symptoms worsen or persist.
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed. She understands that the hydrocodone can cause sedation. She is to not drive or operate heavy machinery after taking it. She understands to not take with other sedating medications / substances, including EtOH and her alprazolam.
- PDMP reviewed and consistent
- Patient expressed understanding and agreement with above treatment plan.

Voice recognition technology may have been employed in the creation of this record.

For G2211, Patient chronically managed by me for ongoing care related to this patient's single, serious, or complex condition; I will follow/have followed the patient longitudinally for this condition

Patient Instructions

Dear Ms.Franklin

Thank you for including me in your health care today.

Here are the diagnoses that we discussed today and what we are doing about it:

ICD-10-CM

1. / **Upper back pain on right side** / **M54.9**

2. / Pain aggravated by coughing and deep breathing / R52

R05.9

Continue ibuprofen / tylenol as needed

Use the hydrocodone / APAP as needed for severe pain

Please make sure you are not getting more then 4000mg / day of tylenol

Please make sure to take these meds with food

We're checking xrays today and will contact you with results.

Please hold off on physical therapy appointment until after xrays are back.

Return to clinic if symptoms increase/change or persist d
espite this plan.

Prescriptions Signed In This Encounter

Medications

• / HYDROcodone-acetaminophen 5-325 MG tablet tab

Formatting of this note might be different from the original.

Yvonne Franklin has provided verbal consent for the use of DAX during today's office visit. Three identifiers (Yvonne Franklin, 6/17/1979, 360-201-2728) have been used to identify the patient.

Modified evaluation performed based on CDC protocols for COVID19.

The pros and cons of a video visit for providing this care were reviewed with Yvonne Franklin and their verbal consent has been given to deliver this visit.

This visit was conducted real time via synchronous interactive video & audio conferencing technology utilizing a HIPAA compliant platform. Patient is located in their home in the state of Washington. Leilani D Paras, MD is located in the EFMC FAMILY MEDICINE office, and is licensed in the state of Washington.

Discussed with patient/parent: You have chosen to receive care through the use of telemedicine.
Telemedicine enables health care providers at different locations to provide safe, effective, and convenient care through the use of technology.
As with any health care service, there are risks associated with the use of telemedicine, including equipment failure, poor image resolution, and information security issues.
You also understand that I cannot physically examine you and that you may need to come to clinic to complete the assessment.

I have discussed the benefits of MyChart. Patient is already signed up for MyChart.

Patient Verifier : Yvonne Franklin, 6/17/1979

Patient is accompanied by her self in the video visit.

Do you consent to the use of telemedicine in your medical care today? Yes

Patient/parent verbally understands the risks and benefits of telemedicine as explained.
All questions regarding telemedicine answered.

Preferred phone number to contact patient is :360-201-2728

Is it okay to leave a detailed voicemail on this number? Yes

Subjective:

Chief Complaint

Patient presents with

• / Follow Up

*Back pain *

HPI:

1. Follow up on back pain
History of Present Illness
The patient is a 46-year-old female presenting for follow-up regarding persistent right upper back pain.

Right Upper Back Pain

- She has experienced constant right upper back pain for two months, which has not improved with physical therapy or prescribed exercises.
- The pain worsens with movement, deep breathing, and sneezing.
- Her husband has noticed that the affected area feels softer than the opposite side, raising concern for inflammation.
- She manages the pain with ibuprofen and Tylenol, taking three ibuprofen and two Tylenol up to three times daily, spaced 4 to 6 hours apart.
- Pain intensity is rated 6–8/10 before medication, decreasing to 1/10 after dosing.
- She is concerned about gastrointestinal effects from frequent medication use and takes them with food and water.
- Hydrocodone was discontinued due to side effects.
- She has not tried muscle relaxants and is considering this option.
- Review of films done on 2/26/26 showed:
- Xray right ribs: Visualized ribs are intact. No displaced fracture.
- Chest x-ray:

-Healed left lateral ninth rib fracture is present.
-Otherwise normal chest.
-No pneumothorax.

Very Frequent Periods

- She plans a separate appointment to address very frequent periods despite having an IUD.
- She wishes to discuss birth control options.

GYNECOLOGICAL HISTORY:

- Very frequent periods

Problem list, medical/surgical history, medications, allergies, immunizations, social and family history reviewed and appropriately updated in Epic.

Limited Exam via patient's / Parent's video

Physical Exam

Constitutional:
General: She is not in acute distress.
Pulmonary:
Effort: Pulmonary effort is normal. No respiratory distress.
Neurological:
General: No focal deficit present.
Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:

Mood and Affect: Mood normal.
Behavior: Behavior normal.
Thought Content: Thought content normal.
Judgment: Judgment normal.

Assessment and Plan:

ICD-10-CM

1. / Upper back pain on right side / M54.9 / REFERRAL / CONSULT TO PHYSICAL MEDICINE REHAB EXTERNAL ONLY

cyclobenzaprine (Flexeril) 10 MG tab

Assessment & Plan

Upper back pain:

- Musculoskeletal pain persists despite physical therapy and analgesics
- Prior x-rays and chest x-ray show no acute fracture; healed left ninth rib fracture is unrelated
- Discussed musculoskeletal etiology, medication side effects, and physical medicine and rehabilitation
- Reviewed sedation risk with cyclobenzaprine and importance of taking medications with food
- No new imaging ordered; previous imaging reviewed
- Refer to Overlake Physical Medicine and Rehabilitation
- Prescribe cyclobenzaprine 10 mg: take 0.5 to 1 tablet up to three times daily as needed
- Continue ibuprofen and acetaminophen as needed with food
- Instruct to avoid driving or operating heavy machinery while using cyclobenzaprine
- Make appointment with Overlake PM&R.
- She will make a separate appointment to address very frequent periods despite having an IUD.
- Return to clinic in the meantime if symptoms increase/change
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.
- Patient expressed understanding and agreement with above treatment plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and e
dited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

NEW PATIENT VISIT

Name: Yvonne K Franklin
MRN: H002293035
Date of Service: 05/12/26
PCP: LEILANI PARAS, MD
Referring Provider: Referred, Self
The following note was created in conjunction with Nuance DAX Copilot Artificial Intelligence. Verbal consent given by patient to allow for recording and processing by DAX software.

Chief Complaint

Chief Complaint

Patient presents with

• / Back Pain

*Patient reports right sided thoracic back pain that started 2/14/26 while on a long drive. Lifting weight, slouching and sneezing exacerbates the pain. Xray 2/26/26 Optum. PT ATI Kirkland 2 sessions, then home exercises. Tylenol and Ibuprofen 3 times daily and helps with the pain. *

History of Present Illness
A 46-year-old female without prior spine history who presents for evaluation of right sided thoracic back pain.

Thoracic Back Pain
Thoracic back pain began 3 months ago, localized to the right side below the inferior border of the scapula, described as a sensation that something is lodged, consistently worse sneezing. Sneezing also causes pain to radiate laterally and wrap around to the abdominal region. Focal pain is aggravated to some extent by by twisting, sneezing, deep inspiration, lifting, and turning in bed. Occasionally radiates - as with sneezing and when the focal pain becomes severe. Symptoms occur daily and have improved minimally if at all. Ibuprofen and Tylenol provide temporary relief. She has tried 2 sessions of physical therapy, (though felt she could do the exercises at home so she has been doing them on her own, without improvement). She has also tried stretching, resistance bands, Epsom salt baths, massage or manual pressure, and topical treatments without significant improvement. Husband tried applying tension and the pain seemed to shift. Pain disrupts sleep when turning in bed. Cyclobenzaprine may be helping with sleep, only taken at bedtime but does not help pain.

- Onset: Began 3 months ago.
- Location: Right side below the inferior border of the scapula, about an inch lateral to the spine.
- Duration: Persistent for 3 months, occurs daily, intensity varies.
- Character: Focal, boring at times, can radiate, especially after sneezing.
- Alleviating/Aggravating Factors: Aggravated by twisting, sneezing, deep inspiration, lifting, and turning in bed; ibuprofen and Tylenol provide temporary relief; cyclobenzaprine improves sleep but not pain; physical therapy, stretching, resistance bands, Epsom salt baths, massage, and topical treatments without significant improvement.
- Radiation: Radiates to mid-axillary region than anteriorly when severe or with sneezing.
- Timing: Disrupts sleep when turning in bed; occurs daily.

Neck Discomfort - not presenting symptom, though noted during exam, supported by hx
Recently developed neck discomfort with limited mobility, possibly related to sleeping position. She uses a neck pillow for support.

- Onset: Recently developed.
- Location: Neck.
- Character: Discomfort with limited mobility.
- Alleviating/Aggravating Factors: Possibly related to sleeping position; uses a neck pillow for support.

ROS: Relevant ROS is negative except as noted in HPI above.

Medications

Current Outpatient Medications:

• levonorgestrel (MIRENA IU), by Intrauterine route, Disp: , Rfl:
• omeprazole (PRILOSEC) 20 MG capsule, Take 40 mg by mouth daily, Disp: , Rfl:
• propranolol (INDERAL) 10 MG tablet, Take 10 mg by mouth as needed, Disp: , Rfl:
• SUMAtriptan (IMITREX) 100 MG tablet, Take 100 mg by mouth every 2 (two) hours as needed for Migraine, Disp: , Rfl:
• valACYclovir (VALTREX) 1000 MG tablet, Take 1,000 mg by mouth as needed, Disp: , Rfl:
• gabapentin (NEURONTIN) 300 MG capsule, Nightly for nerve pain Indications: neuropathic pain, Disp: 30 capsule, Rfl: 1
• meloxicam (MOBIC) 15 MG tablet, Take 1 tablet (15 mg t

otal) by mouth daily For pain, Disp: 30 tablet, Rfl: 1

Physical Exam

- General: Pleasant, alert, interactive female in no acute distress
- Spinal alignment physiologic; no obvious difficulty with transitions or exam
- Neurological: Gait steady and well-coordinated, no functional impairment, patient moves well without guarding
- Neck: No tenderness to palpation of cervical region - midline, facets, or paraspinals; pain elicited in mid cervical spine with flexion motion and thoracic pain reproduced with extension
- Musculoskeletal:
- Thoracic spine (right inferior scapular region T7-T9): Focal tenderness about an inch lateral to thoracic spine on the right; range of motion normal throughout. thoracic pain not triggered with axial rotation, lateral flexion, facet loading, flexion, or extension, nor is it triggered with motion of the shoulder girdle, active or resisted
- Cervical spine: No tenderness to palpation; pain appreciated in mid cervical spine with flexion motion and at presenting thoracic pain reproduced with extension and Spurlings
- Upper extremities (bilateral): Motor strength 5/5 throughout the uppers, including the shoulders; full rotation, normal / symmetrical motion in shoulder girdle; no pain with passive or active range of motion against resistance; sensation intact; reflexes 2+ bilaterally
- Other: Spurling's maneuver to the left reproduces thoracic pain; SI joint tests negative bilaterally

Diagnostics

None available

Results

Imaging

- X-ray of the thoracic spine: 03/2026 - by hx, unremarkable, no report or imaging available
- ray of ribs 2/26 also unremarkable

Assessment and Plan

Yvonne K Franklin is a 46 y.o. female with an approximate 3 month history of right infrascapular pain with minimal if any improvement. When severe or with sneezing, radiates - wrapping out laterally and into the

abdominal region on the right. Exam notable for reproducibility with palpation and spurlings / cervicale extension.

History of radiation suggests thoracic nerve inflammation, while cervical exam / Spurlings and extension removers suggest referred pain from the cervical spine. This may also be a trigger point, given the general location, but radicular pain and cervical provocation indicate need to look more closely at the spine.

Cervical and repeat thoracic X-rays
Meloxicam to replace ibuprofen for simpler dosing
Methocarbamol to replace cyclobenzaprine for less sedation / daytime Rx
Gabapentin given radicular component - HS to help with sleep
Topicals okay +/- heat
Try trigger point - gentle - tennis ball - YTL exercises to both shoulders in supine
Avoid triggering actions
Consider trigger point therapy - manual okay for now - d/w pt, in an effort to find pain relief

Okay to continue PT exercises if not painful

Assessment & Plan

1. Thoracic back pain
Pain localized to right lower scapular region with radiation and focal tenderness, possible referred pattern from cervical spine. Symptoms persistent for 3 months despite stretching and physical therapy exercises along with a litany of supportive measures.

- Discussed possible etiologies, including trigger point or myofascial

pain, referred pain from cervical spine, or localized pathology in thoracic spine with radiating symptoms, or some combination therein. Reviewed risks of anti-inflammatories and nerve pain medications. Explained rationale for imaging and medication changes.

- Order cervical and thoracic spine x-rays. Consider thoracic MRI if x-rays are unremarkable and symptoms persist.
- Start meloxicam once daily to replace ibuprofen for ease of dosing. Continue Tylenol as needed. Start gabapentin at bedtime for nerve pain and sleep. Discontinue cyclobenzaprine to take methocarbamol during the day for muscle tension.

Consider tennis or soft-sh ball in supine for gentle myofascial release.
Consider Pepcid or Protonix if taking anti-inflammatories regularly.

Follow-up: Clinician will review x-ray results and contact patient via MyChart. Further follow-up based on imaging and response to medications.

I spent 5 minutes prior to the visit reviewing history, chart notes, imaging and talking to providers where necessary.
I spent 15 minutes examining the patient.
I spent 15 minutes discussing treatment options with the patient including treatments ranging from conservative to aggressive and invasive.
I spent 10 minutes writing orders for therapies addressing their problems and reviewing and writing their after visit summary
I spent 5 minutes updating the patient's record.
Total time 50minutes

Video Visit. Follow-up on menstrual cycle.

HPI:

History of Present Illness
The patient is a 46-year-old female who is seen via video visit for follow-up of menorrhagia and recent neck pain.

Menorrhagia

- Since August 2025, menstrual cycles occur every 3 weeks, with 1 week of heavy bleeding followed by 1 week of brown discharge, persisting for 9 months.
- Fatigue is attributed to prolonged bleeding and frequent menstrual product use.
- The most recent period began last Thursday (5/7/26) and is ongoing, with an expected 5 days of brown discharge to follow.
- Brown discharge at the end of the cycle is a new symptom.
- An intrauterine device was placed in August 2025; she is considering removal in September 2026 if no improvement in symptoms
- She does not use iron supplements but takes vitamin D and B12.
- She previously tolerated birth control pills.
- There is no personal or family history of blood clotting disorders.
- She is interested in further hormonal testing, including holistic options, but has concerns about some hormone therapies.

-She was previously seen for this on 1/14/26
-Bloodwork at the time was negative except for FSH elevated at 30.2
-Pelvic ultrasound was ordered - she has not yet scheduled it

Right sided thoracic back pain since 2/14/26

- Evaluated by physical medicine and rehabilitation 5/11/26
- Cervical etiology is suspected based on x-rays from 05/11/2026.
- Gabapentin and meloxicam were prescribed and are pending pharmacy fulfillment.

GYNECOLOGICAL HISTORY:

- Last menstrual period: 5/7/26
- Cycle length: 3 weeks
- Duration: 10-14 days
- Heavy bleeding for 1 week, followed by 1 week of brown discharge. Then no bleeding x 1 week and then she restarts cycle with heavy bleeding

She does not use tobacco.

FAMILY HISTORY
She does not have a family history of blood clotting disorders.

Problem list, medical/surgical history, medications, allergies, immunizations, social and family h
istory reviewed and appropriately updated in Epic.

Limited Exam via patient's / Parent's video

Physical Exam

Constitutional:
General: She is not in acute distress.
Pulmonary:
Effort: Pulmonary effort is normal. No respiratory distress.
Neurological:
General: No focal deficit present.
Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:

Mood and Affect: Mood normal.
Behavior: Behavior normal.
Thought Content: Thought content normal.
Judgment: Judgment normal.

Assessment and Plan:

ICD-10-CM

1. / Menorrhagia with regular cycle / N92.0 / Norethin Ace-Eth Estradiol-FE (LOESTRIN FE) 1-20 MG-MCG tablet (28 tab pack)

2. / Chronic right-sided thoracic back pain / M54.6 / Seeing PM+R. Thought to be cervical in origin.

G89.29

since 2/14/26.

?

Assessment & Plan

Menorrhagia

- Periods every 3 weeks with heavy bleeding and brown discharge
- Labs reviewed: thyroid, CBC, ferritin, iron, B12, vitamin D, estrogen, FSH
- Discussed risks and benefits of birth control pills
- Provided information about low-dose estrogen and possible side effects
- Pelvic ultrasound ordered to assess uterine structure before starting birth control pills
- Prescribe Loestrin 1/20 FE:
- Start after ultrasound or sooner if desired
- Start with taking active pills x 3wks, 1 week off and then restart
- If doing well on OCP with improvement in symptoms, she can space out menses to q3 mos
- Provide 84 tablets with three refills for one year

Follow-up:

- Follow up via MyChart message to review pelvic ultrasound report
- Return to clinic / call in the meantime if symptoms increase/change
- Discuss

ed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.

- Patient expressed understanding and agreement with above treatment plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

E/M code was selected based on 30 minutes spent on the date of encounter reviewing pertinent history and previous diagnostics, performing medically appropriate examination and evaluation, ordering diagnostic tests and/or medications, counseling and education to patient/family/caregiver. This excludes activities performed by clinical staff.

For G2211, Patient chronically managed by me for ongoing care related to this patient's single, serious, or complex condition; I will follow/have followed the patient longitudinally for this condition

Patient Active Problem List

| ***PROCEDURE NOTE -***
TRIGGER POINT INJECTION |

Procedure: Trigger point injection, right
Date of study: 06/02/26
Machine: Sonosite HFL50 xp
Transducer: 15 mhz & 8mhz

Patient Name: Yvonne K Franklin
MRN: H002293035
Referring Provider: Spencer, Sarah Jane, PA-C

Subjective:Yvonne K Franklin is a 46 y.o. female with right **Myofascial pain on right side**

Chronic right-sided thoracic back pain

Upper back pain on right side

Myalgia

Description:
After informed written consent was obtained, the patient was positioned in a prone position.

2 muscles palpated (right rhomboid, latismuss dorsi) and trigger points identified. After cleansing with alcohol, all trigger point(s) instilled with 5 ml of 2% lidocaine using a 25 gauge needle.

No complications identified.

Needle was withdrawn, area cleansed and sterile adhesive placed. Patient monitored for 15 minutes post procedure.

FOLLOW UP VISIT

Name: Yvonne K Franklin
MRN: H002293035
Date of Service: 06/16/26
PCP: LEILANI PARAS, MD
Referring Provider: No ref. provider found
The following note was created in conjunction with Nuance DAX Copilot Artificial Intelligence. Verbal consent given by patient to allow for recording and processing by DAX software.

Chief Complaint

Chief Complaint

Patient presents with

• / Back Pain

*Reports pain levels are worse. Looking for next steps. *

Records Reviewed:
Last ov 5/11/26 w/me -

1. Thoracic back pain
Pain localized to right lower scapular region with radiation and focal tenderness, possible referred pattern from cervical spine. Symptoms persistent for 3 months despite stretching and physical therapy exercises along with a litany of supportive measures.

- Discussed possible etiologies, including trigger point or myofascial pain, referred pain from cervical spine, or localized pathology in thoracic spine with radiating symptoms, or some combination therein. Reviewed risks of anti-inflammatories and nerve pain medications. Explained rationale for imaging and medication changes.
- Order cervical and thoracic spine x-rays. Consider thoracic MRI if x-rays are unremarkable and symptoms persist.
- Start meloxicam once daily to replace ibuprofen for ease of dosing. Continue Tylenol as needed. Start gabapentin at bedtime for nerve pain and sleep. Discontinue cyclobenzaprine to take methocarbamol during the day for muscle tension.

Consider tennis or soft-sh ball in supine for gentle myofascial release.
Consider Pepcid or Protonix if taking anti-inflammatories regularly.

History of Present Illness
46-year-old female here today for trigger point injection follow up. Little to no improvement other than less anterior radiation. New symptoms include 2 day history of posterior / mid-axillary lower rib pain without identifiable trigger.

Since 06/12/2026, she developed intense, sudden-onset pain under the left rib upon waking that she compares to a fracture. Pain is localized, non-radiating, worsened by palpation and deep inspiration, and associated with stiffness in the thorax. Stretching has not relieved symptoms. She has not tried steroids in the past. She lifted luggage on 06/11/2026 but denies any pain at the time, reporting the luggage was not heavy. She mentions a healed fracture noted on previous imaging that she had been unaware of, denying prior history of similar symptoms.

For approximately 4 months, she has experienced right-sided symptoms, located medial and inferior to the right shoulder blade that had radiated anteriorly initially, now more focal. The new rib pain began about four days ago and remains unchanged. She denies numbness or tingling. She notes lower back discomfort now as a result of her symptoms, most appreciable when ascending stairs, but no tenderness is found on examination.

ROS: Relevant ROS is negative except as noted in HPI above.

Medications

Current Outpatient Medications:

• gabapentin (NEURONTIN) 300 MG capsule, Nightly for nerve pain Indications: neuropathic pain, Disp: 30 capsule, Rfl: 1

• levonorgestrel (MIRENA IU), by Intrauterine route, Disp: , Rfl:

• omeprazole (PRILOSEC) 20 MG capsule, Take 40 mg by mouth daily, Disp: , Rfl:

• propranolol (INDERAL) 10 MG tablet, Take 10 mg by mouth as needed, Disp: , Rfl:

- SUMAtriptan (IMITREX) 100 MG tablet, Take 100 mg by mouth every 2 (two) hours as needed for Migraine, Disp: , Rfl:
- valACYclovir (VALTREX) 1000 MG tablet, Take 1,000 mg by mouth as needed, Disp: , Rfl:
- methylPREDNISolone (MEDROL, PAK,) 4 mg tablet, follow package directions, Disp: 21 tablet, Rfl: 0

Diagnostics

Results
Reviewed imaging:

- X-ray of ribs: No displaced fracture. Negative rib series on R. Old fracture noted on Left.

Assessment and Plan

1. / **Thoracic radiculitis** / **MRI thoracic spine without contrast**

2. / Costochondral pain

]
Yvonne K Franklin is a 46 y.o. female with persistent infrascapular pain on the right and new posterior rib pain on the left, unclear etiology. Will obtain thoracic MRI to further evaluate given persistence of symptoms after 4 months. No improvement after trigger point. Prior cervical evaluation unremarkable other than referred pain with head rotation.

Assessment & Plan

1. Right-sided thoracic pain - infrascapular - not responsive to trigger point injection

Order thoracic spine MRI to evaluate soft tissue and structural causes as symptoms have not let up in 4 months.

2. Left-sided rib pain - unclear etiology
Severe, localized left rib pain began 06/13/2026, worsened by pressure, without trauma. X-rays and prior records reviewed.

- Prescribe 7-day Medrol Dosepak.
- Discontinue all NSAIDs including meloxicam while on steroids.
- Allow Tylenol and topical treatments for pain.
- Avoid stretching, deep tissue massage, and aggravating activities.

Reviewed steroid side effects. Stretching or deep tissue massage may worsen symptoms.

Follow-up: Follow up after MRI. No specific interval scheduled.

Chief Complaint

Chief Complaint

Patient presents with

• / Follow-up

*Patient here for an MRI review. Reports left sided thoracic back pain. Feels are that had TPI feels better. Looking for next steps. *

Records Reviewed:
Summarized from her Initial visit 5/11/26

46-year-old female with an approximately 3-month history of persistent right infrascapular pain with little to no improvement despite stretching, physical therapy exercises, and multiple supportive treatments. The pain is localized to the right lower scapular region and becomes more pronounced with certain movements and sneezing, at which time it radiates laterally around the right side of the chest wall and into the right abdominal region. On examination, the pain is reproducible with focal palpation over the affected area and is also provoked by cervical extension and a positive Spurling maneuver.

The distribution of symptoms raises concern for thoracic nerve irritation or inflammation, while the reproduction of symptoms with cervical spine provocative testing suggests a possible cervical radicular or referred pain component. A myofascial trigger point remains a consideration given the location and focal tenderness; however, the radicular characteristics of the pain and cervical examination findings warrant further evaluation of the cervical and thoracic spine.
The differential diagnosis, including trigger point/myofascial pain, referred pain from cervical spine pathology, thoracic spine pathology with radiating symptoms, or a combination of these factors, was reviewed with the patient. Given the persistence of symptoms and lack of meaningful improvement with conservative measures, cervical and thoracic spine radiographs were ordered, with consideration for thoracic MRI if x-rays are unrevealing and symptoms continue.
.

History of Present Illness
Yvonne presents today for follow up on her MRI. She is accompanied by her husband. She continues to report thoracic back pain. MRI revealed compression deformities and infiltration involving multiple thoracic vertebrae. She denies additional symptoms and is otherwise healthy. reports good overall health.

ROS: Relevant ROS is negative except as noted in HPI above.

Assessment and Plan

Yvonne K Franklin is a 47 y.o. female an approximate 4 - 5 month history of thoracic back pain here today to follow up on her MRI. Questions were answered to the best of my ability. CT of the chest, abdomen, and pelvis ordered. I reached out by phone and Epic messaging to notify her PCP. Pt has made an appointment with her to discuss this further.

In order to reduce pain and provide her spine with more stability, I will order a TLSO - this will be through Cornerstone, to be worn during the day when out of bed. At all times during the day if tolerated. A TLSO is medically necessary to stabilize the spine in order to decrease mobility and pain in the spine / trunk.

Assessment & Plan

1. **Multiple pathologic compression fractures throughout the thoracic spine concerning for metastatic process from unknown primary**
CT Chest abdomen pelvis ordered stat.
Notified PCP of findings - pt has appt tomorrow.
Patient made appt with PCP to follow up on findings.
TLSO - which is medically necessary to stabilize the spine in order to decrease mobility and pain in the spine / trunk.

I spent 15 minutes prior to the visit reviewing history, chart notes, imaging and talking to providers where necessary.
I spent 15 minutes discussing findings and addressing, questions.
I spent 5 minutes writing orders reviewing and writing their after visit summary
I spent 5 minutes updating the patient's record.
Total time 40minutes

Appt for TLSO tentatively 7/15 @ Cornerstone Kirkland

Subjective:

Chief Complaint

Patient presents with

• / Imaging Test

Patient is here following up on imaging from MR THORACIC SPINE WITHOUT CONTRAST 7/9/2026.

History of Present Illness
The patient is a 47-year-old female presenting for follow-up after recent MRI and ongoing evaluation of back pain, possible malignancy, and other chronic health concerns.

Thoracic Spine Fractures and Back Pain

- Recent MRI revealed multiple thoracic spine fractures.
- Patient reports a skiing fall in 02/2026, landing on her back, but fracture locations suggest a non-traumatic etiology.
- She experiences persistent localized pain, more pronounced on one side, and neck stiffness.
- Over-the-counter 5% lidocaine cream was ineffective.
- Previously tried Percocet but could not tolerate it.

- Has used ibuprofen 600 mg twice daily for 5 months, but is concerned about worsening her chronic stomach issues.
- Requests referral to a thoracic spine specialist (Dr. Ash Patel at Proliance Orthopedics and Sports Medicine) and UW oncology.
- CT chest AP scan is scheduled Monday 9am.

Anxiety and Sleep Disturbances

- Reports significant anxiety and sleep disturbances due to diagnostic uncertainty.
- Previously used Xanax for anxiety but no longer has access and requests a refill.
- Sleep is impaired by pain and anxiety.

Additional Information

- Appetite is generally good, but she notes decreased interest in eating due to stress.
- Currently takes omega-3, vitamin C, and vitamin D supplements.
- Blood work in 01/2026 was normal.

Problem List
Current Medications

ROS:

Negative unless otherwise stated in HPI.

Objective:

Vital Signs:

Blood pressure 116/78, pulse 84, temperature 98.9 °F (37.2 °C), temperature source Temporal, resp. rate 16, height 5' 4.8" (1.646 m), weight 125 lb 9.6 oz (57 kg).

Physical Exam

Constitutional:
Appearance: Normal appearance.
HENT:
Head: Normocephalic and atraumatic.
Eyes:
Conjunctiva/sclera: Conjunctivae normal.
Cardiovascular:
Rate and Rhythm: Normal rate and regular rhythm.

Pulmonary:
Effort: Pulmonary effort is normal.
Neurological:
Mental Status: She is alert.

?

Assessment and Plan:

Assessment & Plan

Pathological fracture of vertebra, unspecified pathological cause, initial encounter

- Discussed risks and possible causes, including metastatic cancer

- Reviewed signs of spinal cord compression and need for urgent care
- Advised to avoid high-impact activities
- CT scan of chest, abdomen, and pelvis pending
- Refer to medical oncology for urgent evaluation
- Refer to thoracic spine specialist for further assessment

Orders:

• REFERRAL / CONSULT TO ORTHOPEDICS (NOT SPINE SURGERY) EXTERNAL ONLY
• REFERRAL / CONSULT TO ONCOLOGY

?

Lytic bone lesions on xray

- Multiple vertebral fractures present, not typical for age or trauma history
- Discussed signs and symptoms of spinal cord compression
- Reviewed importance of urgent evaluation and follow-up
- Refer to medical oncology
- Refer to thoracic spine specialist

Orders:

• Lidocaine 7.5 % cream; Apply 1 gram topically 2 times daily.
• REFERRAL / CONSULT TO ORTHOPEDICS (NOT SPINE SURGERY) EXTERNAL ONLY
• REFERRAL / CONSULT TO ONCOLOGY

?

Generalized anxiety disorder

- Patient experiencing significant anxiety and difficulty sleeping
- Discussed risks and benefits of anxiety medications
- Reviewed importance of support system and communication with family
- Prescribe citalopram for ongoing anxiety
- Prescribe Xanax for acute anxiety episodes, use sparingly

Orders:

• citalopram (Celexa) 20 MG tab; Take 1 tablet by mouth daily.
• ALPRAZolam (Xanax) 0.25 MG tab; Take 1 tablet by mouth at bedtime as needed.

?

Mild intermittent asthma without complication

Refilled
Orders:

• albutero

l HFA (Proventil, Ventolin, ProAir) 90 MCG/ACT inhaler; Take 2 puffs by inhalation every 4 to 6 hours as needed for wheezing or shortness of breath. Not to exceed 10 puffs/24 hours.
?

Migraine without aura and without status migrainosus, not intractable

Refilled
Orders:

• propranolol (Inderal) 10 MG tab; Take 1 tablet by mouth daily.

?

Follow as scheduled with PCP

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Maryan Gelle, MD, who also personally confirmed the chief complaint with patient and completed HPI.

Yvonne Franklin has provided verbal consent for the use of DAX during today's office visit. Three identifiers (Yvonne Franklin, 6/17/1979, 360-201-2728) have been used to identify the patient.

Primary Care and Walk In Clinic Call Assist Center

Is patient a [Delegated (green banner) Medicare Advantage](https://optumcare.sharepoint.com/sites/TECL/SiteDirectory/CASPS/SitePages/CUF-Resources.aspx) or ACO Registry (pink banner) patient? No, please verify provider or department and refer to Care Management algorithm when routing/transferring call.

Provider instructions -- None

Reason for call: Pt is calling in regarding recent appointment from 07.10.26. States the MR results were reviewed and she was referred for a CT. States she completed the CT and the radiologist advised to have a diagnostic mammogram and US and pt is requesting provider to put in an urgent order for these. Would like this to be completed at Fred Hutch at UW.

Caller: Yvonne Franklin
Best number for call back: 360-201-2728

High priority since previous imaging showed pathologic fracture with findings highly suspicious for metastases.

Can we please get a copy of that CT scan? I believe it was probably ordered at Rayus - probably Kirkland because that's where her other imaging has been done.

It sounds like radiologist recommended diagnostic mammogram with ultrasound - just need diagnosis for the imaging (ie, did they see something in her breast tissue that they're wanting diagnostic mammogram for? And need to know if they recommended bilat breasts or just one side.

I guess the easiest thing would be to call Rayus for report? Or ask patient?
Once I get diagnosis, I will order and route diagnostic mammogram and ultrasound orders. Thanks

Leilani D Paras, MD

Per Rayus portal, MRI findings are as follows:

EXAM: MR THORACIC SPINE WITHOUT CONTRAST

HISTORY: 47-year-old female with back pain since mid February after injury in the left.

COMPARISON: None.

TECHNIQUE: Sagittal T1, T2, STIR and axial T2 sequences.

FINDINGS:

There is diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense hypointense marrow signal. This includes 2.3 x 2.3 cm expansile lesion in T5 with smooth cortical remodeling and fluid-fluid levels suggestive of aneurysmal bone cystlike lesion. Similar lesions seen in T1, T8, T9, T10.

There is a 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10 with endosteal scalloping, 7:17.

There compression deformities of T1, T4, T5, and T8 vertebral bodies.

No disc herniation or spinal canal narrowing is seen. There is mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

Mild facet arthropathy seen in the lower lumbar spine.

In the visualized posterior right liver there is a 1.8 cm ovoid T2 hyperintense mass, 7:33. Millimetric T2 hyperintense focus in the posterior left kidney is too small to characterize, statistically likely cyst.

Normal spinal cord morphology and signal is seen.

IMPRESSION:

*Diffusely heterogeneo
us T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vertebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8 cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomen and pelvis with contrast or PET/CT for further evaluation.*

Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.

Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

Electronically signed by Nicole A, RN at 07/13/2026 2:44 PM PDT

Telephone Encounter - Shalece C - 07/13/2026 4:00 PM PDT

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0176

Formatting of this note might be different from the original.
Shalece Christensen, RN of FHCC Nurse Navigation contacted patient by phone to provide education and care coordination. Patient was referred by PCP for FHCC.

Narrative of diagnosis/ reason for care/ goals of care: Patient reports in mid-February she started to have back pain, felt like she couldn't take a deep breath. Saw PCP, x-rays fine. Pain persisted, sent to musculoskeletal specialist who thought maybe pt had muscle strain. X-rays fine, MRI abnormal. Four or five fractures on vertebra as well as lesions on vertebra, likely cancer that has been spreading. Radiologist thinks primary source is elsewhere, referred to FHCC for evaluation

Upcoming/pending appointments: IUD removal tomorrow 7/14

Assessment:
Swollen Lymph Nodes/palpable lump (location): No
Unexplained weight loss (note amount and timeframe): No
Fatigue (0-10): yes, sleeping poorly
Nausea/Vomiting: No
Fever or night sweats: No
Skin concerns (itching, rash, new lesions): No
Pain (location/rating): stiffness/pain in upper back 5-7/10- taking ibuprofen and tylenol for the last 5 months

Respiratory symptoms (cough, SOB): Can't take full breath
Other symptoms of concern reported by patient: has IUD with period every three weeks, spotting with brown discharge; has had current bleeding for 21 days straight

Oncologic History:

Oncology History Overview

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

Thanks for the MRI results.
As part of these MRI results, they *CT chest, abdomen and pelvis with contrast or PET/CT for further evaluation.
*
I believe she had the CT this morning, which is why she was calling for diagnostic mammogram and ultrasound.

Can we please get those CT results from this AM. I have an appointment with her tomorrow to discuss results.
(I don't believe we ordered the CT. I think the physiatrist at Overlake may have?)
Or we can perhaps get in touch with Rayus to see wht they recommended diagnostic mammogram and ultrasound.
Thanks!

Routing to Ana Huston, ARNP: patient has 8AM appointment with you on Tues

She is currently undergoing workup for lytic bone lesions that are suspicious for mets with unknown primary.

Wanted to give you the heads up that she is requesting to have endometrial biopsy at the time of her IUD removal. I told her that you may not have time and that you may not do endometrial biopsies, but I'd let you know in case you wanted to try to do both the IUD removal and endometrial biopsy at her appointment with you on Tues.

Routing to RN pool:

Can you please make sure Ana Huston, ARNP is aware of patient's request? I will likely be busy with clinic and may not have the opportunity to see her before patient's appointment at 8AM

Subjective:

This patient is unaccompanied in the exam room.
Yvonne Franklin has provided verbal consent for the use of DAX during today's office visit. Three identifiers (Yvonne Franklin, 6/17/1979, 360-201-2728) have been used to identify the patient.

Yvonne is a 47 y.o. female who presents for:

Chief Complaint

Patient presents with

• / IUD Removal

*Patient is still bleeding since 6/23/2026 *

Concerns:

History of Present Illness

The patient presented today with concerns related to her intrauterine device (IUD) and ongoing gynecological symptoms.

IUD Removal

- The patient requested removal of her Mirena IUD, which was placed approximately one year ago.

Vaginal Bleeding

- She reported experiencing intermittent vaginal bleeding since her last menstrual period, which began on 06/23/2026.

Cancer Evaluation

- The patient is currently undergoing evaluation for cancer of unknown primary.
- She inquired about the possibility of having an endometrial biopsy performed at the same time as the IUD removal.
- After discussion with Dr. Egnal and Dr. Paras, the plan is to proceed with IUD removal today and defer the biopsy until after a pelvic ultrasound is completed.
- The patient has an appointment with her primary care provider in the next couple of hours and intends to keep that appointment.

Current pharmacy: Safeway Kirkland

Yvonne Franklin has provided verbal consent for the use of DAX during today's office visit. Three identifiers (Yvonne Franklin, 6/17/1979, 360-201-2728) have been used to identify the patient.

Subjective:

This patient is accompanied in the exam room by her spouse, Mark.

Yvonne is a 47 y.o. female who presents for:

Chief Complaint

Patient presents with

• / Results

Discuss CT scan 07/13/2026

History of Present Illness:

Yvonne is here for follow-up on imaging

Briefly, 7/1/2026 MRI thoracic spine (done for thoracic back pain) showed:

- Bone cyst like lesions on multiple vertebral body levels with appearance highly concerning for metastases from unknown primary
- Ovoid hyperintense mass in posterior right liver lobe
- Compression deformities at multiple thoracic vertebral bodies, noted to be possibly pathologic
- Recommended CT chest abdomen and pelvis with contrast or PET/CT for further evaluation

7/13/2026 CT abdomen/pelvis with contrast:
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/13/2026 CT chest with contrast:
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

They recommended diagnostic mammogram and breast ultrasound
Ordered 7/13/26 STAT

Screening:

- last pap 5/26/21 -NILM, HPV neg (due 2026)
- last mammogram and ultrasound 4/10/25 - negative (Evergreen)
- last colonoscopy 10/18/21 - cleared x 5 yrs (Dr. Selinger) - due 10/2026

Complete physical exam scheduled for 9/2026

The patient is scheduled for evaluation at the oncology undiagnosed clinic at Fred Hutch. She is trying to get an appointment wiith neurosurgery at Fred Hutch. She expresses significant anxiety regarding diagnostic uncertainty and is actively coordinating her care.

Pain management.

- She uses NSAIDs, lidocaine, ibuprofen, and Tylenol for pain, but reports significant discomfort and seeks additional relief.
- Given prescription for topical lidocaine 10% patches by another provider. Patient reports that her pharmacy cannot get the 10% lidocaine patch.
- We discussed other options for pain, as her bone pain is significant

Problem List

Current Medications

Reviewed and updated this visit by provider:
Allergies | Meds | Problems |

Review of Systems
Pertinent items are noted in HPI/associated Symptoms and otherwise, all other systems negative.

Objective:

BP 120/78 | Pulse 82 | Temp 99 °F (37.2 °C) (Temporal) | Resp 16 | Ht 5' 4.5" (1.638 m) | Wt 125 lb (56.7 kg) | LMP 06/23/2026 | BMI 21.12 kg/m²

Physical Exam

Vitals reviewed.
Constitutional:
General: She is not in acute distress.
Eyes:
Conjunctiva/sclera: Conjunctivae normal.
Neck:
Thyroid: No thyroid mass, thyromegaly or thyroid tenderness.
Cardiovascular:

Rate and Rhythm: Normal rate and regular rhythm.
Heart sounds: Normal heart sounds.
Pulmonary:
Effort: Pulmonary effort is normal.
Breath sounds: Normal breath sounds. No stridor. No wheezing, rhonchi or rales.
Chest:
Comments: **+TTP 11th rib**
Lymphadenopathy:

Cervical: No cervical adenopathy.
Upper Body:
Right upper body: No supraclavicular adenopathy.
Left upper body: No supraclavicular adenopathy.
Skin:
General: Skin is warm.
Capillary Refill: Capillary refill takes less than 2 seconds.
Neurological:

General: No focal deficit present.
Mental Status: She is alert and oriented to person, place, and time.
Psychiatric

:

Mood and Affect: Mood normal. Affect is tearful **(sometimes tearful when discussing her results)**.
Speech: Speech normal.
Behavior: Behavior normal. Behavior is cooperative.

?

Assessment/Plan:

ICD-10-CM

1. / **Breast cancer screening by mammogram** / **Z12.31** / **MG DIAGNOSTIC BILATERAL MAMMOGRAM TOMOSYNTHESIS**

ULTRASOUND BREAST

2. / Lytic bone lesions on xray / M89.8X9 / US PELVIS COMPLETE WITH TRANSVAGINAL

acetaminophen-codeine (Tylenol #3) 300-30 MG tablet

MG DIAGNOSTIC BILATERAL MAMMOGRAM TOMOSYNTHESIS

ULTRASOUND BREAST

3. / Pathological fracture of vertebra, unspecified pathological cause, initial encounter / M84.48XA / US PELVIS COMPLETE WITH TRANSVAGINAL

MG DIAGNOSTIC BILATERAL MAMMOGRAM TOMOSYNTHESIS

ULTRASOUND BREAST

?

Assessment & Plan

Neoplasm of uncertain origin

- Multiple lytic bone lesions identified on MRI and CT
- No primary malignancy found
- Diagnostic bilateral mammogram ordered stat
- Transvaginal pelvic ultrasound ordered
- Discussed endometrial biopsy risks and low yield if endometrial area is clear
- Emphasized hydration and nutrition before undiagnosed clinic appointment
- Oncology follow-up scheduled for 07/15/2026 at undiagnosed clinic
- Will be scheduling consult with neurosurgeon

Pathologic fracture of left 11th rib

- Fracture with pain on imaging
- Imaging records reviewed
- Discussed pain management and addiction risks with narcotics
- Instructed not to drive while taking Tylenol with codeine
- Prescribed Tylenol with codeine every 6 hours as needed
- She will let us know if this does not give her adequate pain control

Pulmonary nodules

- Scattered lung nodules up to 4 mm on CT
- No evidence of primary malignancy
- CT chest reviewed
- Discussed monitoring protocol and importance of repeat imaging in 3 months
- Repeat CT chest in 3 months
- We discussed this repeat CT chest will likely be done at Fred Hutch with oncology

Follow up

- She has appointment scheduled for oncology tomorrow
- We discussed that they will be taking over her care, and I will follow along.
- Discussed / reviewed indications, risks, benefits, side effects, and proper use of med(s) given today. Questions / concerns re: medication(s) addressed.
- PDMP reviewed and consistent
- Patient expressed understanding and agreement with above treatment plan.

Make Me the Author Attestation: Preliminary History Recorded by Clinical Staff

Preliminary information is recorded by Clinical Staff.
Recorded information was reviewed for accuracy and edited by Leilani D Paras, MD, who also personally confirmed the chief complaint with patient and completed HPI.

Voice recognition technology may have been employed in the creation of this record.

E/M code was selected based on 35 minutes spent on the date of encounter reviewing pertinent history and previous diagnostics, performing medically appropriate examination and evaluation, ordering diagnostic tests and/or medications, counseling and education to patient/family/caregiver. This is excludes activities performed by clinical staff.
For G2211, Patient chronically managed by me for ongoing care related to this patient's single, serious, or complex condition; I will follow/have followed the patient longitudinally for this condition

There are no Patient Instructions on file for this visit.

Patient Active Problem List

Diagnosis

- / Abdominal pain
- / Herpes simplex
- / Internal hemorrhoids
- / Migraine headache
- / Premature ventricular contractions
- / Esophageal reflux
- / Social phobia involving fear of public speaking
- / Supraventricular bigeminy
- / Tension-type headache
- / Vitamin D deficiency

Spoke with patient to discuss where she would like her mammogram done.
She states she had diagnostic mammogram and ultrasound this AM. (She had taken written and signed orders from our appointment yesterday).

She reported that mammogram showed L breast mass and enlarged lymph nodes on right. They have breast biopsy and lymph node biopsy scheduled for next Wednesday.

She has appointment with oncologist on Fred Hutch today at 430.

No further need for mammogram or ultrasound orders. Closing TE

IDENTIFICATION
Yvonne K Franklin is a 47 year old female here today for oncology consultation for cancer of unknown primary with diffuse lytic bone lesions and pathologic vertebral fractures.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? No, not used. Not discussed this visit.
?

ECOG
1 (Restricted in physically strenuous activity but ambulatory and able to carry out work of a light or sedentary nature, e.g., light house work, office work)

History of Present Illness:
47-year-old woman referred for urgent oncology evaluation after imaging demonstrated multifocal lytic osseous lesions and pathologic thoracic compression fractures concerning for metastatic malignancy of unknown primary origin.

Patient reports onset of thoracic back pain in February 2026. It initially started on her upper back by her right scapula but later would migrate to other parts of her back. She had a fall while skiing as well, but the fall event was not in congruent with her back pain. The pain was worsened with sneezing, twisting, lifting, deep inspiration, and turning in bed. Symptoms progressively worsened over several months despite PT exercises, stretching, massage, topical therapies, NSAIDs, gabapentin, muscle relaxants, and trigger point treatment. She subsequently developed left rib pain and difficulty taking a full deep breath.

Thoracic spine MRI obtained 7/1/26 demonstrated diffuse abnormal marrow signal with multiple expansile vertebral lesions involving T1, T5, T8-T10, compression deformities at T1/T4/T5/T8 concerning for pathologic fractures, and possible liver lesion. CT chest/abdomen/pelvis on 7/13/26 showed diffuse lytic lesions throughout spine and pelvis, left 11th rib fracture, and scattered pulmonary nodules up to 4 mm without clear primary malignancy identified.

Currently reports persistent upper thoracic pain/stiffness rated 5-7/10. Taking ibuprofen and acetaminophen regularly for approximately 5 months. Unable to tolerate Percocet previously. Reports fatigue and poor sleep related to pain and anxiety surrounding diagnosis. Appetite generally intact though decreased interest in eating due to stress. Denies unexplained weight loss, fevers, night sweats, nausea, vomiting, palpable lymphadenopathy, or skin changes.

Of note, she reports also reports abnormal uterine bleeding with Mirena IUD in place. She had her Mirena replaced in 8/2025, and since then she has been experiencing cycles occurring every 3 weeks with prolonged bleeding and brown discharge; current bleeding ongoing for approximately 21 days. IUD was removed on 7/14/26, and she continues to have bleeding today. She uses about 3 pads per day and reports the bleeding is not heavy but more than spotting. Prior FSH elevated at 30.2. CT A/P noted small bilateral ovarian cysts.

Past Medical History:
Generalized anxiety disorder
Migraine headaches
Mild intermittent asthma
IBS with diarrhea
Eosinophilic esophagitis
GERD
PVCs/supraventricular bigeminy

Cervical degenerative disc disease
Menorrhagia
Vitamin D deficiency
Gilbert syndrome
Herpes simplex

Past Surgical History:
Breast reduction
Wisdom tooth extraction

Social History:
Lives in Kirkland, WA with husband and two children ages 9 and 11. Never smoker. No current alcohol use.

MEDICATIONS
Current Medications

Albuterol inhaler PRN
Propranolol 10 mg daily
Citalopram 20 mg daily
Alprazolam PRN at nighttime for sleep
Cyclobenzaprine PRN - not taking
Sumatriptan PRN
Omeprazole 20 mg daily
Valacyclovir PRN

Dicyclomine PRN
Mirena IUD - removed yesterday
Loestrin FE - not taking
OTC ibuprofen and acetaminophen

Allergies:
Fentanyl (PVCs)
Propofol (PVCs)

Family History:
Maternal grandmother with colon cancer

Physical Exam
BP (!) 158/83 | Pulse (!) 102 | Temp 36.8 °C (Oral) | Resp 16 | SpO2 98%

GENERAL: Breathing comfortably on room air.
Psychiatric: The patient has a normal affect.

LABORATORY
CBC and CMP are remarkable for CO2 31, BUN 21
CEA 29 or 23 depending on assay.
CA125 28 normal

DIAGNOSTIC STUDIES
CT CAP 7/13/26
Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
Fracture of the left 11th rib.
A few scattered nodules, measuring up to 4 mm.
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/1/26: MRI T Spine
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

Breast Mammo/UW, see report from today
Left
1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.
2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.
3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right
1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.
2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:
Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

ASSESSMENT AND PLAN
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Differential includes metastatic solid tumor, hematologic malignancy including multiple myeloma/lymphoma, or less likely primary bone process

.
Also with chronic abnormal uterine bleeding and bilateral ovarian cysts requiring gynecologic follow-up, though no definitive gynecologic primary identified on CT imaging.

Based on imaging findings and elevated CEA, breast cancer is a leading diagnosis.
Breast biopsy scheduled for next week
Bone biopsy ordered.
PET MR ordered to assess for primary/extent of bony disease

Follow-up with gynecology regarding abnormal uterine bleeding. No hormones until cancer diagnosis established. IUD has been removed.

Pain management - patient will use current opioid and report back.
I will prescribe based on use.

Miralax, senna and MOM for constipation

Anxiety support and symptom management ongoing through PCP and oncology team

Orders Placed This Encounter

HPI:
History of Present Illness
Yvonne K Franklin is a 47 year old female with multifocal vertebral lesions and reported pathologic vertebral compression fractures who presents for evaluation of progressive cancer-related back pain.

Back Pain:

- Mid-back pain below the shoulder blade began in 02/2026 and has progressively worsened to involve the entire back
- Upper back pain characterized by constant tightness; previously the most symptomatic area but now less intense than last week
- Pain limits activity; without medication, upper back pain is 6-7/10, improving to 1-2/10 with medication
- This week developed new sharp, localized right lower back pain, more disabling than upper back tightness
- Right lower back pain triggered by weight-bearing on the right leg and certain twisting motions; worsened by sitting, lying, bending, and most movement
- When triggered, pain is 9-10/10, improving to about 5/10 with medication and by removing pressure/avoiding provoking movements
- Pain has altered gait, with compensation by relying more on the left leg

Neuromuscular Symptoms:

- Generalized weakness
- Caregiver-noted lower extremity atrophy
- No numbness or tingling down the legs

Imaging and Oncologic Workup:

- Thoracic spine MRIs in 06/2026 and 07/01/2026 show multiple vertebral lesions with pathologic fractures at T1, T5, T7, and T8
- Possible liver lesion per caregiver
- Completed PET scan on 07/21/2026
- Medical oncology evaluation has included consideration of myeloma versus breast primary; blood work reportedly "really good"
- Awaiting tissue diagnosis with breast biopsy scheduled for 07/22/2026 and bone biopsy scheduled for Friday

IMAGING:

Results
Radiology
Thoracic spine MRI (07/01/2026): Multiple vertebral body lesions; marked osseous erosion at T8 with compression fracture; additional thoracic lesions; no spinal cord compression. (Independently interpreted)
Chest and lumbar spine CT (07/2026): Multiple vertebral body lesions in thoracic and lumbar spine; marked

osseous erosion at T8 with compression fracture; additional lesions in lumbar region; no major fracture or gross malalignment. (Independently interpreted)
Whole body PET (07/21/2026): Multiple hypermetabolic lesions in vertebral bodies corresponding to osseous erosion; no intracranial involvement; no spinal cord compression. (Independently interpreted)

IMPRESSION / ASSESSMENT:

ICD-10-CM

1. Secondary malignant neoplasm of bone (HCC) C79.51 Referral to Interventional Radiology - Clinic

Assessment & Plan
Spinal osseous metastatic disease with pathologic vertebral compression fractures
Multifocal osseous metastatic disease in thoracic and lumbar spine with pathologic vertebral body erosion and compression fractures, notably at T8, without spinal cord compression or major malalignment. Primary malignancy under evaluation pending biopsy results.

- Urgent referral to Interventional Radiology for vertebroplasty/kyphoplasty for structural support at high-risk vertebral levels.
- Referral to Radiation Oncology for palliative, pain-targeted radiation therapy.
- Present case at weekly spine tumor board for multidisciplinary management and assessment of pain generators and fracture risk.
- Coordinate timing with Radiation Oncology and Interventional Radiology; prioritize radiation if scheduled imminently, followed by cement augmentation if feasible.
- Proceed with breast biopsy today and bone biopsy Friday; compare pathology to determine primary and guide systemic therapy/radiation sensitivity.
- Discuss biopsy consent options for mutation testing and sample preservation with Medical Oncology and biopsy team.

Cancer-related back pain
Severe, movement-exacerbated back pain due to multifocal spinal osseous metastatic disease and pathologic fractures, with persistent upper back pain and new sharp right lower back pain, without neurologic deficits.

- Radiation Oncology evaluation for palliative, pain-targeted radiation; consultation today, simulation/body setup scan Monday.
- Interventional Radiology evaluation for vertebroplasty/kyphoplasty to reduce pain and prevent further vertebral height loss; limit or stage levels treated to reduce procedural risk.
- Coordinate with Medical Oncology for systemic therapy planning post-biopsy results to control disease burden contributing to pain.
- Counseled on shifting pain possibly due to pain flare/inflammatory response or compression fracture settling; maintain close coordination during expedited diagnosis and treatment.

Prior EMR records reviewed as available and clinically relevant. All questions answered. Discharge and follow up instructions were discussed with the patient. The patient fully understands and is in agreement with the plan.

Number and Complexity of Problems Addressed
1 acute, uncomplicated illness or injury
1 undiagnosed new problem with uncertain prognosis
1 or more chronic illness with severe exacerbation, progression, or side effects of treatment
1 acute or chronic illness or injury that poses a threat to life or bodily function

Amount and/or Complexity of Data to be Reviewed and Analyzed
Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported)

Risk of Complications and/or Morbidity or Mortality of Patient Management
Moderate

Julia Anne B Suico - 07/22/2026 10:00 AM PDT

Fred Hutch and UW Medicine / Progress Notes / MyChart DOC0166

Formatting of this note might be different from the original.
Mid-back pain below the shoulder blade since February
Now entire back, upper back is constant and tight, and sharp pain at the lower right side. This week that is feeling worse.
Pain is worse when placing pressure on the RLE, sitting, laying, bending, and any movements.
This affect her gait as she compensates with her LLE.
Relief with avoiding triggers and oxycodone 10mg

BLE atrophy
Generalized weakness
Frail when up and about

PET SCAN

Radiation Oncology New Patient Visit

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: on the road after her breast biopsy with her husband driving
Present with patient: Family member

Patient Care Team:
Purcell, William Thomas, MD as Oncologist (Hematology-Oncology)

PCP: Paras, Leilani D, MD

Referrer: Keith David Eaton

Patient summary
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26 pending bone biopsy 7/24/26. She presents for discussion of radiotherapy.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0.
Innumerable bony foci including compression fractures of T4, T8, L5.
[image]

No problem history exists.

Pain
Pain Score: 5 - Moderate (7/15/2026 4:08 PM)

Safety and Mobility
Have you fallen in the past year?: No (7/15/2026 4:08 PM)

Interval history

Today, Ms. Franklin presents with her husband on Zoom.

She reports a sharp pain over Rt buttock when putting pressure on Rt foot including walking, going to sit down, turning side to side. The pain shoot ups a little bit above buttock up back but largely localized. She is using oxycodone 5mg tab q4h with partial relief.

Wt Readings from Last 9 Encounters:

Imaging and pathology
Reviewed in HPI

Ultrasound Guided Axillary Lymph Node Biopsy Right
Examination:
Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Right Ultrasound Guided Axillary Lymph Node Biopsy complete.

Examination:
Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding,

pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:

Assessment
Yvonne K Franklin is a 47 year old with cancer of unknown primary, possibly Lt breast s/p biopsy Lt breast and Rt axilla 7/22/26 with pending bone biopsy 7/24/26.

We discussed the rationale for and the specifics of treatment.

Given her initial diagnosis and diffuse bony disease, pinpointing the area of pain may be difficult. I suspect her pain could be from Rt ilium, Rt sacum, or L5 compression fracture. During CT-sim, we will place BBs over the location(s) of her pain to help us target.

I plan to treat with 3D conformal technique. Pain relief is equivalent between single fraction vs. multifractionated regimen. The main advantage of multifractionated regimen is a decrease in need for retreatment (about 10 vs

20% at 6 months). About 15% of patients have a complete pain response and 50% have a partial pain response (total of 65% have pain response)

I am thinking of a single fraction of 8 Gy x1 due to low confidence of being able to pinpoint a focus.

If during CT-sim, I am more confident, I may increase dose to 20 Gy/5 fx.

I discussed we would wait for pathology to return a diagnosis of cancer before starting radiation. Some hematologic cancers can respond just as quickly to systemic therapy.

Plan
We discussed in detail the potential risks, benefits, side effects, and alternatives to radiation therapy. Side effects include but are not limited to:
Acute: fatigue, pain flare, nauseas, runny stools
Late: secondary malignancy (>10 years out)

All questions were addressed. The patient agrees with the recommended plan.

-bone biopsy 7/24/26
-CT-simulation already scheduled for Monday 7/27/26
-if pathology results in cancer, plan for either 8 Gy x1 if unsure about target or a higher dose such as 20 Gy/5 fx if physical exam suggests a clearer etiology for her pain.

I spent a total of 60 minutes for the patient's care on the date of the service independent from other healthcare team members. This time encompasses review of records, personal review of imaging, face-to-face discussion with patient, placing orders/referrals, care coordination, and documentation. I provided longitudinal care for complex and serious medical problems.

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0158

Formatting of this note might be different from the original.

Pt underwent moderate sedation for CT guided bone biopsy procedure.

Of note pre-procedurally, pt had an allergy to fentanyl listed in her chart, indicating PVCs as a severe reaction to the medication. Sedation, analgesia, and comfort discussed between the patient, attending, and sedation RN at length in preparation for the procedure, and pt exhibited some skepticism towards her allergy and indicating being receptive to receiving fentanyl for her procedure.

Because pt would monitored closely on telemetry, it was agreed that the procedure would begin with a "trial" dose of 25mcg IV fentanyl followed by a short monitoring period to ensure that there were no EKG changes. Pt tolerated her initial dose of fentanyl with no issues, and so the procedure proceeded with moderate sedation utilizing IV fentanyl and midazolam for pt comfort. Two isolated PVCs were observed through the procedure (approximately 45 minute duration). Pt remained on room air with SpO2 of 100% and appropriate ETCO2 readings. BP steadily trended downward with sedation doses to a low of 85/52 towards the end of the procedure but improved shortly after, as sedation wore off.

After procedure, pt was monitored for a period where occasional, isolated PVCs were observed.

FHCC After-Hours Triage

Yvonne K Franklin is a 47-year-old female with cancer of unknown primary with diffuse lytic bone lesions and pathologic vertebral fractures.

Her husband, Mark, called triage reporting that Yvonne has developed increased pain in her neck and upper back over the last few hours. Having a hard time finding a comfortable position. No relief with oxycodone 10 mg taken at 10pm (almost 3 hours ago). Denies radiating pain, extremity numbness or weakness, urinary or stool incontinence.

I advised her to take another 5 mg of oxycodone now along with 1,000 of tylenol.

She has an appointment with rad-onc at UW in the morning. May need urgent imaging if pain persists. Will cc Dr. Shepherd (rad-onc) and ACE clinic for possible evaluation.

RN called to discuss note from after hours triage regarding her pain in her right side of neck. She reports not being able to find a comfortable position and was unable to lay dow. Had not slept well r/t pain. Called the triage line and they recommended to see her in ACE.
RN spoke to patient on the phone and confirmed that her pain was still a 10/10 and having difficulty holding up her head feeling that it "was really heavy".
RN spoke to the ACE provider and was able to get her in to the ACE clinic at the UW for further evaluation.

RN placed follow up reminder.

[image]

INTERVAL HISTORY

Yvonne presents to ACE via referral from primary oncology team for evaluation of acute on chronic neck and back pain with muscle spasms.

She developed acute, severe neck and back pain with muscle spasms beginning last night around 10 pm. Patient reports that she has had ongoing cervical and thoracic back pain iso newly diagnosed lytic lesions with undiagnosed primary; however, this pain has significantly worsened with muscle tightness in the neck, shoulder blades, and left thoracic/lumbar region. She is unable to lay down or move without debilitating pain and slept sitting up due to discomfort. She describes a sensation that her head is "too heavy" for her neck and expresses concern about rapid progression of symptoms.

Her current pain regimen includes oxycodone 5-10 mg every four hours and tylenol, with minimal relief. She has not been on a long-acting opioid. She also uses prochlorperazine for nausea; however, endorses poor appetite.

She had an appointment with radiation oncology today for a CT simulation for planned palliative radiation treatment. She denies lightheadedness, dizziness, chest pain, shortness of breath, abdominal pain, nausea, vomiting, new bladder or bowel dysfunction, new swelling or pain in her legs, or weakness or sensory changes in her extremities.

REVIEW OF SYSTEMS

Review of Systems
Constitutional: Negative for fever.
Cardiovascular: Negative for chest pain and dyspnea on exertion.
Respiratory: Negative for cough and shortness of breath.
Musculoskeletal: Positive for back pain, neck pain and stiffness. Negative for muscle weakness.
Gastrointestinal: Negative for abdominal pain, change in bowel habit, nausea and vomiting.
Genitourinary: Negative for dysuria.
Neurological: Negative for dizziness, headaches, light-headedness, numbness, paresthesias and sensory change.

Psychiatric/Behavioral: Negative for altered mental status.
?

IMAGING/PERTINENT STUDIES

Ultrasound Guided Axillary Lymph Node Biopsy Right
Addendum: Pathology results reveal axillary node with metastatic carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/2026 at 1556.
Narrative: Examination:
Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Right Ultrasound Guided Axillary Lymph Node Biopsy complete.
US Guided Breast Biopsy Left, Post Procedure Diagnostic Mammography Left
Addendum: Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.
Narrative: Examination:
Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and

alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.
XR T Spine 3 Vw
Narrative: EXAMINATION:
XR T SPINE 3 VW

CLINICAL INDICATION:
Localize levels of pain in spine

COMPARISON:
July 27, 2026 thoracic spine MRI and CT..

FINDINGS AND
Impression: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.
MRI C-T-L Spine w wo Contrast
Narrative: EXAMINATION:
MRI C-T-L SPINE WO/W CONTRAST

CLINICAL INDICATION: Stage IV breast cancer.
metastatic cancer, lytic lesions in spine, spinal stenosis

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,6 mmol Intravenous,07/27/2026 2357

COMPARISON:
CT 7/27/2026.

FINDINGS:

SPINAL CORD: The conus medullaris terminates at the level of L1-L2, was in normal limits. There is no abnormal cord signal or abnormal cord enhancement.

SPINE: Mild apparent straightening of the normal cervical lordosis could be positional. The normal thoracic kyphosis is maintained. There is mild apparent straightening of the normal lumbar lordosis. Small central disc protrusions are seen at C3-C4, C5-C6 and C6-C7 as well as L2-L3 and L3-L4 resulting in impression of the ventral thecal sac. There is no significant canal or foraminal stenosis.

There is diffuse osseous metastasis in the cervical, thoracic, lumbar and sacral vertebral bodies as well as posterior elements.There are mild compression fractures involving T4, T5 (40% height loss) and T8 vertebral bodies. Possible fluid fluid level at T5 may represent hemorrhage within the vertebral body. L3 vertebral body demonstrates superior and inferior endplate Schmorl's nodules.

There is anterior epidural soft tissue extension at T5 (series 1301 image 10/17) and T8 (series 1601 image 18/62 without cord compression. There may also be possible epidural extension at T4.
Impression: 1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

ASSESSMENT/PLAN

Assessment & Plan
Yvonne K Franklin is a 47-year-old female with cancer of metastatic breast cancer with diffuse lytic bone lesions and pathologic vertebral fractures. Patient's pathology came back today and she has not established with breast oncology to discuss treatment.

Patient presents today with chief complaint of significant worsening of neck and back pain.

In ACE, afebrile, BP 134/91 mmHg, HR 92, RR 18, SpO2 100% on RA. Initially experiencing 10/10 neck pain despite taking extra dose of 10 mg oxycodone.

Work-up:

- CMP overall stable
- CBC overall stable

Ordered CT full spine to further assess acute on chronic spinal pain that is impacting ADLs.

Resuscitated with 1 mg IV, 0.5 mg IV, 1 mg IV dilaudid. Pain temporarily improved with each dose of dilaudid; however, relief did not last long.

Upon reassessment, patient does not feel that she can go home given the significant amount of pain and inability to ambulate or complete ADLs secondary to pain.

I reviewed findings relevant to this acute encounter with the patient along with plan of care as below:

#Acute on chronic cancer related pain
#Metastatic breast cancer with extensive lytic osseous involvement
Acute neck and back pain with significant progression over past 24 hours. CT spine shows lytic osseous metastases involving multilevel vertebra. Unable to independently walk or move neck thus admitting for ongoing pain mgmt and further work-up.

- Neurosurgery requesting full spine MRI w and w/o contrast and neck CTA
- Spoke with IP team. Will admit for pain mgmt and consult IR and radiation oncology
- Sending to ED given no availability for direct admission
- Palliative care referral placed; spoke with palliative care who recommended morphine 30 mg BID and methocarbamol 750 TID for OP management but will defer to IP team
- OP FHCC will get patient established with breast oncology

DISPOSITION

Patient discharged from ACE in stable condition and brought to ED.

FOLLOW UP

- Per IP recommendations

ATTESTATION

I spent 75 minutes on the care of this patient today including medical records review, assessment, diagnosis, management, documentation and care coordination with the patient's primary oncology team, neurosurgery, ED attending, IP team, and ACE team.

Interpretation/Language Services: No Interpreter

Summary: Pt arrived via ambulation with spouse after getting mapping done in radiology. Reports severe 10/10 spasming of upper back and neck. Reports upper back has been ongoing but the neck is what started to get worse last night. Reports her neck and back is "seizing up and spasms". Reports chills. Denies fevers, SOB, chest pain, dizziness, changes in sensation, or weakness. Reports bowel and urination has remained normal. PIV 20G places, tolerated well, labs collected. CT full spine with contrast completed. Received IV Hydromorphone x3 with moderate effect but still very stiff and finding difficult to perform ADLs. Pt agreed to needing further workup for pain management. APP gave handoff to ED Attending. Pt stable and transferred via wheelchair by staff with partner to ED due to no bed availability per APP.

Additional documentation may exist in Flowsheets or Education Activity

HISTORY OF PRESENT ILLNESS AND REVIEW OF SYSTEMS

Yvonne K Franklin is a 47 year old female patient with history of progressive neck and thoracic pain since February recently found to be secondary to metastatic brain cancer with diffuse lytic bone lesions who presents with severe neck pain.

Patient developed acute severe neck and back pain with muscle spasms that began around last night. She has been using oxycodone to help with her pain, takes 10 mg every 4 hours though this is not adequate to control her pain now. She presented to the oncology clinic earlier today for evaluation. Had a radiation oncology appointment today for CT simulation for planned palliative radiation therapy. In oncology clinic, she underwent a CT full spine which demonstrated worsening osteolytic lesions with pathologic fractures and spinal stenosis. She was sent to the ED for admission. Endorses severe neck and back pain at this time. Denies paresthesias or paralysis, bladder or bowel issues
Has not noticed any difficulty moving her limbs or numbness and tingling anywhere in her body. She does note that is very difficult to walk because of her pain and that when she raises her arms up it also exacerbates her pain.
D
Denies any shortness of breath, chest pain, nausea or vomiting, changes in urinary or bowel habits.

Review of systems as noted above in HPI otherwise other systems reviewed and found to be negative or noncontributory.

External records of patient were reviewed: Oncology note from today.
Interpreter was not used
An independent historian was not used to corroborate patient’s presentation and history.

Vital signs and nursing notes reviewed

Physical Exam
GEN: tearful-appearing patient on ED stretcher, moderate distress
EYES: EOMI, no discharge or bleeding
NOSE: no rhinorrhea
MOUTH: no visible lesions on oral mucosa
CARDIAC: RRR, no rubs/murmurs, strong radial pulse, no pedal edema
CHEST: symmetric chest rise and fall, no accessory muscle use, CTAB - no wheezing/rhonchi/rales
ABDOMEN: non-distended, soft, non-tender, no masses palpable

MSK: Significant midline tenderness of the C-spine on palpation, limited range of motion of the neck due to significant pain
SKIN: no erythema, rashes, abrasions, lacerations, edema on visible skin
NEURO: patient is alert and oriented, able to answer questions appropriately and follow commands
CN: pupils are 3 mm, equal, round, reactive to light bilaterally, EOMI, sensation intact to all facial dermatomes, facial muscles symmetric at rest and on activation, hearing grossly intact, palatal rise symmetric on phonation, tongue protrusion midline, SCM strength intact
MOTOR: moving all extremities spontaneously, limited flexion of BUE d/t pain, symmetric grip strength, finger extension intact bilaterally, no pronator drift bilaterally, no drift of BLE, dorsiflexion against resistance intact bilaterally
SENSORY: sensation to crude touch intact to upper and lower extremities bilaterally

Final Result

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast

Final Result

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

Radiology Final Result:
No image results found.

ED COURSE/MEDICAL DECISION MAKING

Nontoxic but anxious appearing 47-year-old female with a history of metastatic breast cancer with diffuse lytic bone lesions and possible trickle vertebral fractures presenting from oncology clinic where she presented with worsening neck and back pain. CT full spine demonstrated lytic osseous metastases involving multilevel vertebra with pathologic fractures, some extraosseous extension of the spine with spinal canal narrowing. She was sent to the ED for admission and further workup of her pain. I discussed this patient with oncology and neurosurgery and they have requested further imaging studies. Plan for symptomatic control and admission for further workup and management.

Please see ED course below for updates on patient's workup and management.

ED course:

ED Course as of 07/28/26 1934

Mon Jul 27, 2026

1935 Discussed patient's case with oncology. Oncology stated that preliminary plan was to have IR consult and possible radiation oncology. However with spinal findings, neurosurgery was involved and had requested MRI full spine and CTA head and neck pending neurosurgery recommendations, patient will be admitted to med service [TL]

1935 I discussed patient's case with medicine triage. They asked that we wait for neurosurgery recommendations prior to admission. Paged neurosurgery. [TL]

2000 I discussed patient's case with neurosurgery. No plans for operative management, neurosurgery will not admit to their service. Plan for admission to medicine of service. I informed oncology and medicine team [TL]

ED Course User Index
[TL] Le, Tudi, MD

I discussed patient's presentation and/or management with: oncology, NSGY, medicine.
Social determinants of health that affect patient's care today include: NA

Based on patient's HPI, examination, and today’s work-up, it is my clinical judgement patient's presentation is most consistent with metastatic breast cancer, pathologic spinal fractures, lytic spinal lesions. Labs and/or imaging were independently interpreted by me. On reassessment, patient's vitals were stable and their exam remained unchanged.

Ultimately, patient was admitted to medicine O service. Sign out to admitting provider is complete

Medications given in the ED:

History and Physical

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
PCP: Paras, Leilani D, MD
Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
Undergoing outpatient workup for presumed metastatic breast cancer (breast/LN biopsy results 7/27 confirm breast cancer, pending bone biopsy results). The night preceding admission developed acute worsening of neck and back pain to the point of being awoken from sleep and unable to bend or perform standard ADLs 2/2 severe, 10/10 pain unresponsive to home oxycodone 5-10mg. Pain is in the R neck and bilateral paraspinal regions, primarily in the upper/thoracic spine, worse with movement and associated with a feeling of "heaviness" in her head as if she cannot hold her head up due to pain/weakness in her neck.
She was seen in Radiation Oncology on 7/27 for CT sim for XRT planning and then presented to ACE clinic for severe pain and was recommended to proceed to the ED for neurosurgical evaluation given severity of neck pain and known C spine metastases.
No fevers, chills, new neurologic symptoms of focal weakness, numbness, tingling, loss of bowel/bladder control.
ED course:
Afebrile, VS notable for tachycardia and transient hypertension. Labs with mild hypokalemia and leukocytosis, otherwise unremarkable. CT spine demonstrated multiple osseous metastases with multiple associated pathologic fractures in the cervical and thoracic spine and extra-osseous extension of lesions in the C-spine (e.g. C4, C6) with associated foraminal narrowing. CTA head and neck without e/o arterial dissection or occlusion.

Admitted to medicine for pain control and possible expedited XRT.

OUTPATIENT MEDICATIONS:

Current Outpatient Medications

Medication Instructions

- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- ALPRAZolam (XANAX) 0.25 mg, Nightly PRN
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- oxyCODONE 5-10 mg, Oral, Every 4 hours PRN
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily
- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily
- tretinoin 0.025 % cream 1 application, 3 times weekly

ALLERGIES:
Propofol and Fentanyl

OBJECTIVE

T: 37.5 °C (07/27/26 1658) BP:(!) 150/92 (07/27/26 1658) HR:(!) 112 (07/27/26 1658)

IMAGING:
I have reviewed the latest radiology results

MRI C-T-L Spine w wo Contrast

Final Result by Blackmore, Christopher Craig, MD (07/28 0142)

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result by Johnson, Chenara, MD (07/27 2148)

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

PATHOLOGY:
I have reviewed the latest pathology results
7/22 Lymph node Right and Breast Left:

Final Diagnosis

A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

ASSESSMENT/PLAN
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

#Stage IV breast cancer
#diffuse osseous metastases
Breast/lymph node biopsy 7/22 c/w metastatic breast cancer, not yet on any systemic therapies. Undergoing outpatient planning for XRT and recently completed CT sim on 7/27 but admitted from ACE clinic with intractable pain affecting ability to ambulate and perform ADLs outpatient. NSGY consulted in the ED, no surgical intervention planned, spine lesions not functionally unstable. Admitted for pain control and expedited inpatient initiation of palliative XRT for pain control, additionally will consult IR for consideration of vertebroplasty/kyphoplasty for structural support per outpatient NSGY note for high risk vertebral level involvement.
Consults:

- NSGY
- Radiation Oncology - order placed AM consult
- IR for vertebroplasty/kyphoplasty - order placed, AM consult

Diagnostics:
[ ] f/u MRI
Therapeutics:
Pain management

- APAP 975mg q8H SCH
- Continue home oxycodone 5-10mg q4h PRN
- IV HM 0.5-1mg q4h PRN
- Methocarbamol 750mg q6h PRN
- C-spine soft collar for comfort

#migraines
#GAD

- continue propranolol
- HOLD alprazolam, uses rarely outpatient

Medical decision-making included the following:

Acute/chronic condition that poses a threat to life/bodily function OR chronic illness with severe exacerbation/progression/side effects of treatment: Metastatic breast cancer with diffuse osseous metastases

Treatment with parenteral controlled substance(s), monitoring for oversedation, respiratory depression, and hypotension

Inpatient Checklist:
Fluids/Electrolytes/Nutrition: Regular
Prophylaxis: lovenox
Lines/Drains/Airways: PIV
Disposition: Acute care pending pain control and XRT plan
Code Status: Full Code

Occupational Therapy Evaluation

Patient Name: Yvonne K Franklin
MRN: U4772842
Total Treatment time: 20 Minutes

Home Living: Type of Home: Multilevel home
Entry Stairs: 2-3 without railing
Indoor Stairs: 1 flight with 1 railing the entirety of spiral staircase, intermittently has 2 railings
Lives With: Family
Lives with Comments: Mark (husband), 2 young children
Assistance Available at Home : 24 hour assistance
Bathroom Toilet: Standard
Mobility Equipment Owned: None

Home Living Comments: Kirkland, WA

Prior Level of Function: BADLs: Independent
IADLs: Requires assist
Functional Mobility: Independent
Details of previous level of function: Yvonne hasn't been able to perform IADLs including cooking, housework. Spouse Mark has taken over those.

Upper Extremities:

--- ---

Lower Extremities:

Hand Function:

Coordination:

Sensation:

Proprioception:

Vision:

Perception:

Cognition: Overall Cognitive Status: Within Functional Limits

Subjective: "It seems silly but I can't even lift a plate. I feel it all the way up my neck."

Current Level of Function

Toileting: Independent

Toilet/Commode Transfer: Independent

Therapeutic Interventions

Functional Transfers

Sit>Stand: Independent

Functional Mobility: within the room independently and ambulates with spouse Mark with arms linked together

ADL/IADL Comments: Yvonne's primary trigger for pain from a functional standpoint is getting in and out of bed, as in her head descent to gravity. She is also unable to tolerate laying flat. OT provided education in options including use of bed wedge(s) vs 1st floor hospital bed. Also demonstrated how spouse Mark can provided physical assist at her head/neck while she transitions from sitting > supine. Yvonne describes log rolling to manage pain and OT built upon that strategy to include no bending/lifting/twisting in her day. Ordered 3 different cervical collars for patient to try and explained the mechanism of soft support.

Assessment

Assessment: Upon interview, Yvonne is and has been able to complete bathing, toielting, dressing and self care on her own but struggles with IADLs that include any lifting or bending. OT provided education in maintaining a neutral spine and gave ideas for strategies and supplies to support her painful neck area during bed mobility. Will follow up as needed for usefulness of cervical collars and justify a hospital bed as needed.

Session Tolerance: Patient limited by pain, Patient tolerated treatment well

In House OT Plan

Plan: Skilled OT

Treatment Interventions: Self-care/Home management, Caregiver education/training

Frequency: 1-2 more sessions

Coverage for Next Shift: f/u on neck collar and rule out need for rental hospital bed

Discharge Recommendations

Recommendations: No further OT needed

Barriers to Discharge: none anticipated

Assistance with: IADLs

Supervision with:

Equipment Recommended: Hospital bed vs bed wedge

Goals

1. Goal: Bed mobility, Tolerate orthosis without complications, Minimum Assist (less than 25% help needed), Adaptive equipment
Estimated Completion Date: 07/31/26

2. Goal: Toileting, Toilet transfer, Independent
Estimated Completion Date: 08/01/26

Progress Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

SUBJECTIVEINTERVAL HISTORY:
Pt endorses neck and back pain ongoing since February and acutely worsening over the weekend, which prompted her admission overnight. She has had stiffness in neck, upper extremities, and back that makes certain movements difficult, including bending forward at the waist and lying flat. She also notes pain with arm movements. Her pain is significantly improved on current multimodal regimen.

Pt and her husband (present at bedside) are understandably distraught regarding her recent metastatic cancer diagnosis. They would like to know more about the plan for treatment, including radiation and long term therapeutic options. Explained ongoing discussion with IR/rad onc/med onc which will inform a treatment plan in the coming days.

SCHEDULED MEDICATIONS:

- acetaminophen, 975 mg, q8h SCH
- cholecalciferol, 4,000 units, Daily
- enoxaparin, 40 mg, q HS
- polyethylene glycol 3350, 17 g, Daily
- propranolol, 10 mg, Daily
- senna, 17.2 mg, BID

INFUSED MEDICATIONS:
?

PRN MEDICATIONS:

- albuterol HFA, 2 puff, q4h PRN

- HYDROmorphone, 0.5-1 mg, q4h PRN
- HYDROmorphone, 1-2 mg, q10 min PRN
- melatonin, 3 mg, q HS PRN
- methocarbamol, 750 mg, q6h PRN
- ondansetron, 4 mg, q8h PRN
- ondansetron, 4 mg, q8h PRN
- oxyCODONE, 5-10 mg, q4h PRN
- prochlorperazine, 10 mg, q6h PRN
- prochlorperazine, 10 mg, q6h PRN

OBJECTIVE

IMAGING:?
I have reviewed the latest radiology results
MRI C-T-L Spine w wo Contrast
Result Date: 7/28/2026
1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels. Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

CTA Head and Neck Angio
Result Date: 7/27/2026
1. Normal head CT. No acute infarct, hemorrhage or mass effect. 2. Normal CTA head. No high-grade stenosis or occlusion. 3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

CT Full Spine w Contrast
Result Date: 7/27/2026
Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT.

PATHOLOGY:?
I have reviewed the latest pathology results

7/24/26:
A) Right iliac crest, biopsy:

- Metastatic carcinoma.

7/22/26:
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Biomarker reporting: ER positive, PR positive, HER2 negative. Negative E-cadherin supports lobular phenotype.

ASSESSMENT/PLAN?
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

#Stage IV breast cancer
#Diffuse osseous metastases
Breast, lymph node, and iliac crest biopsies consistent with metastatic breast cancer, ER+/PR+/HER2-, not on any systemic therapies. Admitted for pain control (iso intractable cancer-related neck/back pain with known

osseous metastases) and possible expedited inpatient initiation of XRT. MRI 7/28 notable for diffuse metastatic lesions in cervical, thoracic, and lumbar spine as well as anterior epidural tumor extension at T5 and T8.

- Neurosurgery consulted in ED; no surgical intervention planned; spinal lesions not functionally unstable.
- Radiation oncology consulted; XRT scheduled tomorrow 7/29 at 3:30 pm.
- Medical oncology consulted; they will evaluate pt tomorrow 7/29 for consideration of chemotherapy initiation.
- Interventional radiology consulted re: possible vertebroplasty/kyphoplasty for stabilization (final recs pending).
- Outpatient oncologist Dr. Eaton aware. Will need to schedule for outpatient follow-up with breast oncology prior to d/c (not currently following).
- Pain management:
- MS Contin 30 mg q12h SCH
- APAP 975mg q8H SCH
- Continue home oxycodone 5-10mg q4h PRN
- IV HM 0.5-1mg q4h PRN
- Methocarbamol 750mg q6h PRN
- C-spine soft collar for comfort

#Migraines
#GAD

- Continue propranolol
- HOLD alprazolam, uses rarely outpatient

Transfers
Sit<>Stand: Independent
Ambulation
Distance: 180ft

Assistance Needs: Supervision / Stand by assistance
Assistive Device Used: None
Gait quality/descriptors: Narrow BOS;Decreased pace;Decreased step length
Stairs
Comments: Deferred this date due to pain

Interventions:
Theract:

- Pt, caregiver edu: PT POC, PT frequency, benefit of upright mobility and small bouts of activity for pain and fatigue management, fall risk safety, role of DME
- Indep bed mobility with HOB elevated and light use of railing, demos half log roll/half "crunch" with polite refusal of log roll trial iso pain and pt report she has found the least painful way to demo bed mobility
- Indep transfers without overt LOB, no AD, cueing for pacing for pain management
- Gait as above without overt LOB, pt denies inc in pain with amb, denies lightheadedness/dizziness, pt endorses feeling unsteady due to pain meds, FWW provided for hallway ambulation if continues to feel loopy during future walks
- Stairs deferred due to pain

ASSESSMENT/PLAN
Yvonne presents to PT evaluation with impaired mobility and activity tolerance iso pain and decreased stability. She demos bed mobility, transfers, and in room mobility independently without overt loss of balance. She ambulates 2 laps around unit with supervision assist and no AD, demo'ing no overt loss of balance although pt reports unsteadiness due to pain meds. FWW provided for pt to use in hallway. Anticipate no mobility barriers for home d/c. She benefits 1-2 further inpatient PT sessions to progress mobility, trial stairs, and order DME prn.

Recommend a personal ride for transportation as the patient is able to demonstrate a transfer as needed to access their vehicle, as well as positioning tolerance to manage the ride time/distance at discharge.

Barriers to Discharge: 1 flight of stairs to access living environment, anticipate no mobility barriers

Discharge Equipment: TBD, likely FWW

Goals:
Goal: Bed mobility, Independent (Flat mattress, no railing)
Estimated Completion Date: 08/15/26
Goal: Amb with AD, Independent
Estimated Completion Date: 08/15/26
Goal: Stairs, Supervision / Stand by assistance (x1 flight)
Estimated Completion Date: 08/15/26

Acute Care PT Plan of Care:
Treatment/Interventions: Therapeutic exercise, Therapeutic functional activities, Neuromuscular re-education, Gait/Stairs training, Wheelchair management training, Patient/family training
PT Plan: Skilled PT
PT Dosage: 1-2x/week
Plan for Next Session: Pre-med for pain, stairs, order AD prn, flat bed mobility, introduce f/u PT options including FHCC OP PT

Other Recommendations:
Recommendation for PT After Hospital Discharge: Comments (OP FHCC PT?)
PT Daily Recommendations: Walking in hallway 2-3x daily

INTERVENTIONAL RADIOLOGY
CONSULT NOTE
REFERRING SERVICE: Medicine
CONSULT REASON: Vertebroplasty

PATIENT IDENTIFICATION / CHIEF COMPLAINT:
Yvonne K Franklin is a 47 year old female presenting with with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

HISTORY / INDICATION:
Pt admitted for pain control, MRI demonstrates extensive spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention indicated per NSGY. Patients pain this morning is better controlled after titration of medication. She is scheduled for otpt radiotherapy currently later this week.

PHYSICAL EXAM:

Vitals (Most recent)

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with a history of Metastatic breast cancer affecting multiple thoracic spinal levels. She is currently admitted for pain control as a result of this condition.

Given patients diffuse pain with some localized component to the affected levels as seen on imaging/spinal xray, it is possible patient would benefit from vertebroplasty. In particular, after discussion with our radiation and medical oncology colleagues, there is likely some benefit for vertebroplasty for stabilization of these levels during and following treatment. Given these benefits, will consider vertebroplasty for both structural and pain benefits, will need additional workup prior to procedure, which will follow radonc tx.

-Will plan for outpatient follow-up with Dr. Som for additional workup
-Will consider inpatient vertebroplasty in the inpatient setting if patient remains in house.
-Treatment per radiation oncology prior to vertebroplasty.

This consult was discussed with IR Attending, Dr. Som.

Thank you for the consult. Please contact Interventional Radiology (IR) via paging operator with questions at any time.

Associated Order(s): IP CONSULT TO NUTRITION SERVICES
Formatting of this note might be different from the original.
Nutrition Screen:
Patient presenting d/t acute severe neck and back pain with muscle spasms iso known diffuse lytic lesions is admitted for further management.
Is s/p CT simulation for XRT on 7/27/26

PMH significant for new stage IV breast cancer with diffuse osseous mets to multiple cervical, thoracic, and lumbar vertebral bodies with T4, T5, and T8 vertebral body pathologic fractures, iliac crest mets, s/p L breast biopsy 7/22/26, migraines, GAD

Subjective:
Roused from napping, food at bedside (bananas, yogurt, fruit, drinks) states she already had some food to eat but with poor appetite, noted emesis bag nearby, pt endorses some nausea.

Nutrition interventions:
Received consult d/t weight loss on screening.

Reviewed chart, discussed current intakes, POC.
Encouraged good po intake as tolerated, ok for small bland choices at this time.
Encouraged good po intake with adequate calories and protein to meet nutritional needs, for best outcomes during tx.

Plan:
Will continue to monitor status and POC (XRT? Chemo?)
Will monitor for adequacy of po intake
Will re-screen weekly if LOS extended

Nutrition History PTA:
Patient sleepy, keeping eyes closed, minimally engaged at this time, did not address at this time.

Po Intake:
No data found. Patient reports eating some bfast

GI: nausea (Last BM: 7/26/26)

Wounds:
R anterior hip biopsy site

Food Allergies: No food allergies

Active Diet Orders

Diet

Adult Diet Regular

Code Status: Full Code

Inpatient Consult to Radiation Oncology
Consult performed by: Anderson, Eden, MD
Consult ordered by: Lazarevic-Fogelquist, Adrian, MD

?

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26, s/p bone biopsy 7/24/26 (result pending). She presented with worsening pain from osseous mets in the spine.

Radiation oncology consulted for consideration of extensive expedited inpatient radiation therapy

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
Patient is known to our outpatient radiation oncology team, she is followed by Dr. Kang as an outpatient. They were planning for radiation therapy from approximately C3-T11, unfortunately patient's back pain worsened since the time of her simulation and she was admitted to UWMC.

Neurosurgery is not offering operative intervention, however interventional radiology considering kyphoplasty. In my discussion with her today she endorses pain largely originating from the neck and upper back. Denies weakness/numbness, or paresthesias.

She expresses a desire to initiate radiation therapy soon as possible. Radiation plan is nearly complete, planned outpatient start date was 7/30.

IMAGING:
I have reviewed the latest radiology results

XR T Spine 3 Vw

Final Result by Shibata, Dean Kazuo, MD (07/28 1614)

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast

Final Result by Blackmore, Christopher Craig, MD (07/28 0142)

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result by Johnson, Chenara, MD (07/27 2148)

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

ASSESSMENT/PLAN
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26, s/p bone biopsy 7/24/26 (result pending). She presented with worsening pain from osseous mets in the

spine.

Radiation oncology consulted for consideration of extensive expedited inpatient radiation therapy

Overall her presentation is consistent with pain crisis secondary to osseous metastatic lesions. We wish to make every effort to avoid a prolonged hospitalization given the need for her to establish outpatient with FHCC medical oncology for systemic therapies.

She is already planned for radiation therapy to the painful osseous lesions, however we will work to expedite her radiation start date. Anticipate radiation therapy start tomorrow 7/29. This will likely be followed by kyphoplasty as an outpatient.

Summary of Recommendations:

- Anticipate radiation therapy start 7/29/2026, 3:30 PM

This case was discussed with attending physician, Dr. Kang.

If further questions arise during this admission, I can be contacted via Epic Secure Chat for non-urgent issues, or by paging the on-call radiation oncology resident for urgent matters. The radiation oncology inpatient resident consult service will continue to follow.

Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain, admitted for pain control and expedited XRT.

SUBJECTIVEINTERVAL HISTORY:
Pt endorses increased pain overnight as well as mid-morning today. Her pain is present throughout the day, not specific to particular time, but does generally seem worse at night/with reclined position. Evaluated at ~11am, and she reported significant pain (~2 hrs since last oxycodone dose). She does not feel that ER morphine has been helping since this was initiated yesterday PM. She also has been experiencing nausea 2/2 oxycodone and IV hydromorphone use, currently receiving IV anti-emetics.

SCHEDULED MEDICATIONS:

- acetaminophen, 975 mg, q8h SCH
- cholecalciferol, 4,000 units, Daily
- enoxaparin, 40 mg, q HS
- morphine ER, 30 mg, q12h SCH

IMAGING:?
I have reviewed the latest radiology results
XR T Spine 3 Vw
Result Date: 7/28/2026
On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast
Result Date: 7/28/2026
1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels. Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

CTA Head and Neck Angio
Result Date: 7/27/2026
1. Normal head CT. No acute infarct, hemorrhage or mass effect. 2. Normal CTA head. No high-grade stenosis or occlusion. 3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

CT Full Spine w Contrast
Result Date: 7/27/2026
Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT.

PATHOLOGY:?
I have reviewed the latest pathology results

7/24/26:
A) Right iliac crest, biopsy:

- Metastatic carcinoma.

7/22/26:
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Biomarker reporting: ER positive, PR positive, HER2 negative. Negative E-cadherin supports lobular phenotype.

ASSESSMENT/PLAN?
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain, admitted for pain control and expedited XRT.

#Stage IV breast cancer, ER+/PR+/HER2-

Diffuse osseous metastases

Breast, lymph node, and iliac crest biopsies consistent with metastatic breast cancer, not on any systemic therapies. Admitted for pain control (iso intractable cancer-related neck/back pain with known osseous metastases) and possible expedited inpatient initiation of XRT. MRI 7/28 notable for diffuse metastatic lesions in cervical, thoracic, and lumbar spine as well as anterior epidural tumor extension at T5 and T8.

- Neurosurgery consulted in ED; no surgical intervention planned; spinal lesions not functionally unstable.
- Radiation oncology consulted 7/28. Plan for single treatment/ 8 Gy x1. XRT scheduled today at 3:30 pm.
- Hydroxyzine 10 mg x1 given for pre-procedure anxiety.
- Medical oncology consulted; anticipate outpatient initiation of hormone therapy (final recs pending).
- AM LFTs ordered
- Interventional radiology consulted 7/28. Plan for vertebroplasty/kyphoplasty for stabilization in outpatient setting following radiation therapy.
- Outpatient oncologist Dr. Eaton aware. Will need to schedule for outpatient follow-up with breast oncology prior to d/c (not currently following).

Neck and back pain, secondary to above

Pt continues to have uncontrolled neck/back pain despite initiation of MS Contin 30 mg BID yesterday 7/28 together with oxycodone 10 mg q 4h prn and additional prn IV medications as below. She has been experiencing significant nausea 2/2 oxycodone use. Trial of 1x PO hydromorphone 4 mg was ineffective for pain control.

- Pain management:
- MS Contin 30 mg q12h SCH
- APAP 975mg q8H SCH
- Increase oxycodone to 10-15 mg q 3h PRN
- Methocarbamol 750mg q6h PRN
- Cont IV HM 0.5-1mg q4h PRN for now, though plan tooptimize PO pain management in anticipation of d/c

- Bowel reg: daily Miralax/Senna
- C-spine soft collar for comfort

Nausea, 2/2 opioid use

- Increase Zofran to 8 mg q 8h SCH; plan for scheduled antiemetics x 1 week following radiation therapy given increased pain control needs
- Cont PO compazine 10 mg q6 hrs prn

#Migraines
#GAD

- Continue propranolol
- HOLD alprazolam, uses rarely outpatient

Inpatient Checklist:
Fluids/Electrolytes/Nutrition: Regular
Prophylaxis: lovenox
Lines/Drains/Airways: PIV
Disposition: Acute care. Anticipate possible discharge Thursday 7/30 pending XRT and pain control needs.

Consult Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

Inpatient Consult to Oncology
Consult performed by: Zhang, Michelle Yu, MD

Consult ordered by: Lenaeus, Michael Jeffrey, MD

?CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old pre-menopausal female with new dx of metastatic breast cancer (ER 3+/ PR 3+, HER2-) w/ multifocal lytic osseous lesions (biopsy confirmed breast cx) and pathologic thoracic compression.

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
She had mammogram 4/2025 that was benign. She was then in her overall state of health when she had onset of backpain 2/2026. The pain progressively got worse - she did not notice functional limitations until ~ 3 weeks ago when she had more pain with carrying plates/ things around the house.

She presented for care and subsequently had MRI spine 7/1/2026 with expansile lesions in T1, T5, T8-T10 with expansile element in T10. CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout spine and pelvis, left 11th rib fracture. Few scattered lung nodules.

She was seen in clinic 7/15 with undiagnosed mass clinic. She had a PET-CT 7/21 with FDG avid lesion in L breast c/f breast neoplasm, R LAD, innumerable FDG avid lesions associated with compression fractures involving several vertebral bodies.

Her last period was ended ~ 2 weeks ago. It was much longer than typical e.g. 3 weeks- she just had IUD removed. On ROS denies dental issues or other chronic health conditions.

Estrogen exposure: she was on birth control pills from 18-33 then switched to Mirena IUD. This is her second IUD.
ECOG: 1 pain limiting function but remained active. She was walking 30 minutes but more slowly due to pain.
SH: works in office. She has two kids 9& 11 yo. She drinks 1-2 drinks alcohol on a few to most nights of the week. Denies history of smoking.
FH: grandmother had colon cancer at in 60s
ONCOLOGY HISTORY:
7/13/2026: CT CAP lytic lesions, L 11 rib fracture a few lung nodules.
7/21/2026: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
7/22/2026: R axilla LN biopsy- metastatic carcinoma, L breast core biopsy - IDC. Biopmarker of L breast shows ER+ (3+) PR (3+) HER2 negative. Ki-67 21-30%

MEDICATIONS:
SCHEDULED MEDICATIONS:

- acetaminophen, 975 mg, q8h SCH
- [START ON 7/30/2026] anastrozole, 1 mg, Daily
- cholecalciferol, 4,000 units, Daily
- enoxaparin, 40 mg, q HS
- leuprolide acetate, 7.5 mg, Once
- morphine ER, 30 mg, q12h SCH
- ondansetron, 8 mg, q8h SCH
- polyethylene glycol 3350, 17 g, Daily
- propranolol, 10 mg, Daily
- senna, 17.2 mg, BID

- [START ON 7/30/2026] zoledronic acid, 4 mg, Once

INFUSED MEDICATIONS:
?

PRN MEDICATIONS:

- albuterol HFA, 2 puff, q4h PRN
- HYDROmorphone, 0.5-1 mg, q4h PRN
- melatonin, 3 mg, q HS PRN
- methocarbamol, 750 mg, q6h PRN
- oxyCODONE, 10-15 mg, q3h PRN
- prochlorperazine, 10 mg, q6h PRN

ALLERGIES:
Propofol and Fentanyl

OBJECTIVE

T: 37.2 °C (07/29/26 0801) BP: 124/65 (07/29/26 0801) HR:(!) 101 (07/29/26 0801)

ASSESSMENT/PLAN
Yvonne K Franklin is a 47 year old pre-menopausal female with new dx of metastatic breast cancer (ER 3+/ PR 3+, HER2-) w/ multifocal lytic osseous lesions (biopsy confirmed breast cx) and pathologic thoracic compression.

#lytic lesions
T4,T5, T8, sternum, ribs
L 9th rib expansile lesion w/ soft tissue component
#11th rib fracture
#Lytic lesions in throracolumbar spine/ sacrum as well as bilateral iliac bones
#few lung nodules - indeterminate

Today we reviewed she has metastatic (stage IV) breast cancer, meaning it is incurable. However there are many lines of effective treatment in metastatic breast cancer / survival is generally measured on the timeline of years. Given her ER+/PR+ status, she is a candidate to start inpatient hormone therapy. We would recommend she speak further without patient oncologist regarding long term treatment planning - standard first line therapy would include additional CDK4/6 inhibitor.

For her symptoms we would recommend adding zometa for bony pain and will also help with bone density. Can also consider adding NSAID for multimodal control of bony pain as well.

- add on ca 15-3
- lupron 7.5mg (1 mo dose)
- anastrazole 1mg daily
- zometa 4mg
- consider NSAID for additional adjunctive pain control
- outpatient oncology fu
- consider child life referral

Please reach out if you have any questions or concerns. Patient was staffed with Dr. Coveler, attending physician.

Michelle Zhang, MD
Hematology/Oncology Fellow

Discharge Planning Assessment

Patient summary:"47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive pain and inability to perform ADLs. Admitted for pain control and expedited inpatient initiation of palliative XRT for pain control. "

Denies HH services history.
Provided Planning Your Home Discharge flyer.

Visit Information:
Patient is a 47 yrs female admitted on 7/27/2026 for Breast cancer metastasized to bone, unspecified laterality (HCC).
Discharge Planning Assessment Type: Discharge Planning Assessment (Face-to-Face) (a friend and her husband at bedside)
Is an interpreter used:: No
Is this a planned admission: No, Admission Source: Admitted through ED
Did pt/family decline dc planning evaluation/assistance? No

Living Situation Prior to Admit:
Living Situation Prior to Admission: Home with family/support (lives with her husband and 2 minor-aged children)

Pt reports that they felt their needs were met in living situation: Yes
Home Accessibility Concerns: Stairs/number at home (2 story home, 2 ste, 20 stairs+HR up to bedrooms, walk-in shower with built-in bench)
Primary Caregiver: Self
Support System: Spouse/significant other;Family members;Friends/neighbors
Physical/Cognitive/Functional History: No Limitations
Access to Healthcare Prior to Admit:No/minimal barriers to healthcare
Activities of Daily Living Prior to Admission:
PTA-Independent with ADLs?: Yes

PTA-Memory Adequate to Safely Complete Daily Activities: Yes
PTA- Adequate self-medication management: Yes
PTA-Patient Able to Express Needs/Desires: Yes
PTA-Dressing: Independent
PTA-Feeding: Independent
PTA-Bathing: Independent
PTA-Toileting: Independent
PTA-In/Out Bed: Independent

PTA-Walks in Home: Independent
PTA-Ambulates in Community: Independent

PTA-Assistive Devices: Wheelchair (manual wc)

Last Recorded Vitals
There were no vitals filed for this visit.

Wt Readings from Last 5 Encounters:

07/28/26 57.2 kg (126 lb 1.7 oz)

07/27/26 57.1 kg (125 lb 12.8 oz)

07/21/26 55.7 kg (122 lb 12.7 oz)

07/15/26 56.7 kg (125 lb)

Subjective
She presents with her spouse Mark. She has no side effects attributable to radiation.

I discussed we are treating C4 to T11 with a single palliative dose with the intent for pain control and allowing my IR colleagues to better localize areas for stabilization. We may need a few weeks for pain control.

Objective
On hospital bed
No acute distress
No increased work of breathing

Please let patient know that we received a note about her having both alprazolam and morphine. Please confirm morphine is being prescribed at Fred Hutch.

I know she knows this, but please confirm she knows to NOT take any sedating medications or substances together - the alprazolam and morphine are both sedating so should not be taken together and they should not be taken with other sedating substance (like alcohol).

Will leave form in my inbox, which I've completed. Please fax back in after we've discussed with pt. Thanks

Physical Therapy Discharge

Yvonne K Franklin
U4772842

7/30/2026
Duration of session: 10 Minutes

Subjective
Patient Report/Self-Assessment: Agreeable to PT, hoping to discharge today

Functional Level:
Bed Mobility
Supine to Sit: Independent
Sit to Supine: Independent
Transfers
Sit<>Stand: Independent
Ambulation
Distance: Within room

Assistance Needs: Independent
Assistive Device Used: Front wheeled walker
Gait quality/descriptors: Narrow BOS;Decreased pace;Decreased step length

Interventions:
Therex:
Theract: Pt reports recently has been holding onto spouse while walking in hospital. Edu on safe walker use, sizing, ordering. Politely declined to practice steps
Balance/Neuro Re-ed:
Gait Training:

ASSESSMENT/PLAN
Yvonne is looking forward to discharging later today, reports she has been holding onto spouses arm for stability when walking lately, agreeable that walker would be beneficial for home. Ordered FWW, edu on safe use and sizing. Pt politely declined to practice steps. No further acute PT needs

Recommend a personal ride for transportation as the patient is able to demonstrate a transfer as needed to access their vehicle, as well as positioning tolerance to manage the ride time/distance at discharge.

Barriers to Discharge: None

Discharge Equipment: FWW

Justification for Ambulatory Assistive Device

Diagnosis: R26.81 impaired balance and M62.81 generalized weakness

Length of Need: >6 Months

Assistive Device: Yvonne requires a FWW for safe ambulation and transfers within the home. Without this equipment Yvonne is at risk for falls and injury. There is not a lesser restrictive device that would serve Yvonne's

safety and mobility needs. Yvonne has demonstrated safe use of this equipment during this or previous PT sessions.

Goals:
Goal: Bed mobility, Independent (Flat mattress, no railing)
Estimated Completion Date: 08/15/26
Goal: Amb with AD, Independent
Estimated Completion Date: 08/15/26
Goal: Stairs, Supervision / Stand by assistance (x1 flight)
Estimated Completion Date: 08/15/26

PT Plan of Care:
Discharge acute care physical therapy. Please re-order therapy if the patient has a change in status, and therapy interventions are needed again.

Other Recommendations:
Recommendation for further PT: Outpatient PT
PT Daily Recommendations: Walking in hallway 2-3x daily

Documentation only:
Oncologic History:

Oncology History Overview

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.

* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of

epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

7/29/26 Palliative radiation to C4-T11 800cGy in Fx

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of treatment options for Vertebral Augmentation.

HISTORY OF PRESENT ILLNESS -The history is from the patient as well as from review of medical records. Pt was recently admitted for pain control of significant metastatic disease. MRI demonstrates spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention was indicated per NSGY, and patient was discharged following adequate pain control. She has received outpatient radiation therapy yesterday, which she tolerated well.

PAST MEDICAL HISTORY

Active Ambulatory Problems

Diagnosis Date Noted

- Secondary malignant neoplasm of bone (HCC) 07/22/2026
- Neck pain 07/27/2026
- Cancer related pain 07/27/2026
- Breast cancer metastasized to bone, unspecified laterality (HCC) 07/27/2026
- Acute bilateral thoracic back pain 07/28/2026
- Pathologic compression fracture of vertebra (HCC) 07/28/2026
- Metastatic malignant neoplasm (HCC) 07/28/2026
- Cancer, metastatic to bone (HCC) 07/28/2026

Resolved Ambulatory Problems

Diagnosis Date Noted

IMAGING STUDIES
[image][image]

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain with less acute, sharp pain at the level of T8 as recently localized, despite the appearance of compression fractures near and at this level.. She has had adequate pain control with oral medication, though notes persistent pain despite that throughout her full spine, most prominently of the cervical spine.

The pain does not localize as well to the mid and lower thoracic vertebrae, therefore vertebral augmentation is deferred for now. The areas of pain in her cervical spine were explained to be inaccessible in regards to kyphoplasty. Recommended use of cervical collar/brace for pain and protection.

Will follow-up in approx 3 weeks in clinic to assess for need for kyphoplasty at that time.

Thomas Perez, MD
I saw and evaluated the patient and agree with Dr.Perez's note.

Patient was seen jointly with Dr. Som in the IR clinic.

Oncology Telephone Triage Note

Subjective / Visit Information:

Reason for Call: Symptom Management (constipation)

Assessment and Plan:

Call Summary: patient contacted triage reporting several days of constipation with very small hard BM on Tuesday and Friday of this week. Taking large doses of narcotics, drinking 30mL fluid, not moving a ton. Reports she is taking senna 2 tabs BID and miralax once a day without relief. Passing gas and still eating, denied bloating/abdominal pain.

Action Taken: Provider Notified Hailey Bobin-Cole who recommended increasing miralax to BID and adding MOM, prune juice sprite/butter cocktail. If this addition does not work can use 1/2 bottle of magnesium citrate. Also discussed more consistent bowel regimen once she gets a successful movement, including increased fluids, more movement and addition of coconut milk to her diet. Instructed patient to contact us with any further questions/concerns if these suggestions are not fruitful, patient agreed to do so.

Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, Restates plan, and No further questions

Additional documentation may exist in Flowsheets or Education Activity

FRED HUTCHINSON CANCER CENTER
BREAST ONCOLOGY NEW PATIENT VISIT

ID/CC: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) with primarily bone involvement presenting today to establish care with breast oncology

ONCOLOGY HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma
-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the

right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

HPI: Please see detailed oncology history above. We spent the majority of the visit reviewing the diagnosis and discussing treatment recommendations. Please see details in the assessment and plan.

ROS: Complete ROS was reviewed and was negative unless stated above in the HPI

ECOG: 0 (prior to diagnosis)

PATHOLOGY

Left Breast Core biopsy and Right axillary lymph node 7/22/26 (copied from report)
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

TUMOR

Tumor Site Clock position

1 o'clock

Tumor Site Distance from nipple (Centimeters): 7 cm

Histologic Type Invasive carcinoma with features of: lobular

Histologic Grade (Nottingham Histologic Score)

Glandular (Acinar) / Tubular Differentiation Score 3

Nuclear Pleomorphism Score 2

Mitotic Rate Score 1

Overall Grade Grade 2 (scores of 6 or 7)

Largest Invasive Focus in this Limited Biopsy Sample 7 mm

Ductal Carcinoma In Situ (DCIS) Not identified

Lymphatic and / or Vascular Invasion Not identified

Microcalcifications Not identified

Breast Biomarker Studies (pending) Biomarkers have been ordered and will be reported in an addendum.

Testing Performed on Specimen / Block Number(s) A1

Test(s) Performed

HER2 by Immunohistochemistry (IHC) Status Negative (Score 1+)

Incomplete membrane staining that is faint / barely perceptible and in greater than 10% of tumor cells

Test(s) Performed

Ki-67 Proliferative Index 21-30%

ASSESSMENT/PLAN: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) with primarily bone involvement presenting today to establish care with breast oncology

#Breast Cancer: Patient presented with several months of back pain. An MRI on 7/1/26 showed expansile lesions in T1, T5, T8-T10. Subsequent CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules. PET CT on 7/21/26 showed FDG avid lesions in L breast, R axilla, and bones. Left breast core biopsy on 7/22/26 showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30%. Right axillaary LN biopsy showed metastatic carcinoma. Right iliac crest biopsy also showed metastatic carcinoma. She subsequently admitted for pain control and started on lupron+anastrozole. We reviewed today that this presentation is consistent with metastatic or stage IV breast cancer. We discussed the natural course and prognosis of metastatic breast cancer. I shared that metastatic breast cancer is considered incurable, it is

treatable with a goal of improving both quantity of life and quality of life. We discussed that in this setting treatment primarily involves systemic treatment which is given on an ongoing basis until disease progression or intolerable side effects develop at which time we would switch to a new line of therapy provided there are reasonable options remaining that are within the patient's goals of care. Surgery and radiation would not be curative but are sometimes used to help manage symptoms. The recommendation for AI + CDK 4/6 inhibitor is based on multiple trials demonstrating superior efficacy compared with endocrine therapy alone. The PALOMA-2 trial demonstrated the combination of AI + Palbociclib was associated with improved PFS (24.8 versus 14.5 months; hazard ratio [HR] 0.58, 95% CI 0.46-0.72) and objective response rate (ORR; 42 versus 35 percent) compared with letrozole alone. The MONALEESA-2 trial of ribociclib plus letrozole showed a significant overall survival benefit as compared with placebo plus letrozole in patients with HR-positive, HER2-negative advanced breast cancer (63.9 months, 95% CI 52.4 to 71.0 with ribociclib plus letrozole vs 51.4 months, 95% CI 47.2 to 59.7 with placebo plus letrozole). The MONARCH3 trial demonstrated the combination of AI + abemaciclib was associated with improved PFS (28.2 months versus 14.8 months for those receiving placebo; HR 0.540, 95% CI: 0.418, 0.698) and objective response rate (ORR; 59 versus 44 percent) compared with letrozole alone. In summary, AI+CDK4/6 inhibitors are now standard of care for first line treatment of metastatic, ER+ positive/Her2- breast cancer. Given the side effect profile, we discussed proceeding with ribociclib. We discussed the potential SEs of ribociclib includes but is not limited to neutropenia, decreased blood counts, LFT changes, fatigue, QTc prolongation (which requires EKG monitoring) and rarely pneumonitis. We discussed evaluating disease response with scans q3 months; in her case I will recommend PET/CT in the setting of bone predominant disease.
-Continue lupron q4 weeks
-Continue anastrozole daily
-Plan to start ribociclib pending insurance authorization
-Repeat PET CT due November 2026
-Referrals for nutrition, SW, and childlife
-Will send next generation sequencing on tumor sample
-She scheduled to meet with palliative care tomorrow

#pain management:
-Regimen prescribed during her admission

- MS Contin 30 mg every 12 hours
- Oxycodone 15 mg every 3 hours as needed
- Tylenol 975 mg every 8 hours
- Methocarbamol 750 mg every 6 hours as needed
- Recommend daily bowel regimen

-s/p palliative RT

#Bone Mets: We discussed the data supporting the use of bisphosphonates in patients with bone metastasis to prevent fracture and decrease pain. The risk of ONJ and atypical femur fractures is low/unlikely at the doses given. Common side effects include arthralgias and fevers after the infusion.
-Continue zometa q4 weeks

#Genetics: Genetic testing recommended in the setting of metastatic breast cancer

Return: 2 weeks for start of ribociclib

Anti-Cancer Therapy Consent

I/we spoke with the patient about the proposed treatment regimen: Ribociclib
The purpose of this treatment is: Disease control – the goal is to improve quality of life and/or length of life, not to cure the cancer
Other options for treatment and their risks and benefits were discussed, including no treatment.
Potential side effects of therapy were discussed. These include, but are not limited to: Fatigue and Risk of Infection, Sores of Mouth and Throat, Change in Taste Sensation, Anorexia, Nausea/Vomiting, Constipation and Diarrhea, Neutropenia, Low Red Blood Cell Count/Anemia and Low Platelets and Risk of Bleeding, Skin Effects, Heart Effects, Lung Effects and Liver effects,
The patient had the opportunity to ask questions and expressed understanding of the proposed treatment and agrees to proceed.
She may also receive written materials on the regimen schedule and toxicity and, if applicable, a chemotherapy teaching session with a nurse or pharmacist.

FHCC PALLIATIVE CARE NOTE

VISIT INFORMATION:
Date of Service: 8/4/2026
Type of Visit: Initial Visit
Referral Reason: Cancer-related pain, Symptom management (non-pain), and Emotional support/coping

ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

[No matching plan found]

Addressed during this visit: Patient's narrative, Symptom management, Optimizing quality of life, and Education about palliative care
Participants: Patient and Spouse: Mark

PLAN:
Problem: Education about palliative care
Impression: Explained the role of palliative care including services provided and philosophy of care.
Plan: Pt agrees to ongoing palliative care support

History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with metastatic stage IV invasive lobular breast cancer with osseous metastases who presents for cancer pain management and initial visit with palliative care.

Referred after a recent hospitalization for a pain crisis.

Over several months prior to diagnosis, mid-Feb 2026 marked onset of focal sharp right subscapular pain with a pleuritic component and difficulty taking a breath. Initial X-rays were negative. Pain persisted despite MSK specialist evaluation, PT, repeat X-rays, and a 7 day course of oral steroids without benefit. MRI obtained 7/1/26 after the request process began around 6/1/26, followed by biopsies and PET scans. No preceding breast symptoms; routine annual mammograms with ultrasound due to dense breasts.

Cancer pain primarily involves the neck and back, worsened by position changes and muscle engagement including lying down, sitting down or standing up, turning in bed, twisting, and carrying light items. She avoids bending and uses a straight-line squat to pick items up. During last week's pain crisis, neck pain with spasms limited mobility and she was unable to walk at the time of a radiation consultation. Since discharge on the current regimen, worst pain 7/10 with improvement to 2-3/10 after medication. Intermittent chills occur shortly before pain returns when oxycodone is due. Overnight sleep previously required alarms for dosing; last night she slept through a 2 AM alarm and awoke at 5 AM without increased pain.

Current analgesic regimen: morphine ER 30 mg twice daily at 9 AM and 9 PM; oxycodone IR 15 mg every 3 hours around the clock, typically 6 doses per day and 5 doses last night; extra-strength acetaminophen three times daily; methocarbamol 750 mg four times daily. Skipping methocarbamol for a day worsened symptoms. Opioid side effects include loopiness and brain fog; sedation was worse initially and has improved somewhat with acclimation.

Constipation has been significant on opioids. Current bowel regimen: Miralax twice daily and senna 2 tabs twice daily; over the last 2 days she added prune juice plus milk of magnesia due to absent bowel movements, which has been effective but has led to loose or liquid stools. Nausea has been well controlled for about a week; she continues the hospital regimen of two antiemetics on a scheduled alternating pattern, one about every 6 hours and one about every 8 hours, and she denies current nausea.

Goals of Care
Caregiver was present for the discussion. I explained the role of palliative care as a consultative service alongside oncology to support quality of life, symptom management, and assistance with advance care planning and decision support.

She described living at home with her spouse and two children and identified additional support from her mother, brother, sister-in-law, and local friends. She shared plans to take about a month off work to focus on getting pain controlled and adjusting to treatment, with the goal of returning to her usual routines if treatment is effective. She emphasized that maintaining normal life, meaning, and purpose through work and family roles is important for her coping.

I asked her to summarize her understanding of the illness. She stated she has stage IV breast cancer that is treatable but not curable and has spread to bone, with pain as the presenting symptom. I reinforced that metastatic breast cancer can be very treatable and that symptom improvement can be dramatic with effective therapy, with the goal of stabilizing disease while preserving function and quality of life.

She expressed hope that treatment will allow reduction of opioid use due to unwanted side effects and brain fog. She articulated a minimum acceptable quality of life centered on being awake, functional, and not overly sedated, while also avoiding uncontrolled pain. We discussed balancing analgesia with alertness and function, including the shared goal of sleeping through the night without setting alarms for breakthrough dosing.

She raised concerns about financial impact of cancer care despite having good insurance. I discussed that most families with good insurance are typically able to avoid major out-of-pocket costs, reviewed the role of appeals and alternative medication options when coverage barriers arise, and encouraged contacting the care team rather than paying unexpected high pharmacy charges. I noted availability of patient navigation resources for insurance and disability-related questions.

She discussed upcoming Child Life support to help talk with her children about the diagnosis and her desire for transparency to maintain trust. I affirmed this priority and reviewed availability of social work and family support resources.

Assessment & Plan
Cancer pain management
Cancer-related axial skeletal pain from metastatic breast cancer improved but requires frequent short-acting opioids with functional limitations and side effects.

- Increase morphine ER to 30 mg PO TID.
- Continue oxycodone IR 10-15 mg PO q3-4h PRN; take at pain onset (4-5/10).
- Morphine ER and oxycodone IR may be taken together.
- Take oxycodone IR before bed for nocturnal pain.
- No alarm for overnight dosing; take PRN if pain wakes her.
- Continue acetaminophen and methocarbamol; maximize acetaminophen between oxycodone doses.
- Continue methocarbamol 750 mg; stagger doses and reassess for sedation.
- Do not crush oxycodone tablets.
- Palliative care team to manage opioid changes and refills; coordinate with oncology.
- Nursing check-in Friday for pain control and PRN use; update morphine prescription.
- Follow up with palliative care pharmacist next week.
- Follow up with palliative care clinician in a couple of weeks; telehealth acceptable.
- Contact palliative care team for urgent issues or medication needs.
- Notify palliative care team 3-4 days before running out of medications.
- Signed opioid agreement form.

Opioid-induced constipation
Opioid-induced constipation managed with multi-agent regimen; high risk persists due to opioid and antiemetic use.

- Continue senna 2 tabs PO BID.
- Continue polyethylene glycol 1-2 times daily; increase if no bowel movement by day 2.
- Use prune juice and milk of magnesia as rescue therapy.
- Target soft, formed bowel movement every 1-2 days.
- Increase activity and hydration.
- Reduce or stop scheduled ondansetron.
- Contact palliative care team if constipation persists.

Nausea
Nausea previously present on opioids, now controlled with antiemetics.

- Discontinue scheduled antiemetics; use PRN at nausea onset.
- Prefer prochlorperazine PRN; use ondansetron if ineffective.
- Trial one antiemetic PRN at a time.

Metastatic invasive lobular breast cancer to bone
Stage IV ER/PR-positive, HER2 low/negative metastatic breast cancer with bony metastases; treatable but not curable. Early symptom improvement noted.

- Coordinate with oncology for disease-directed therapy; palliative care for symptom management.
- Continue Lupron, anastrozole, Zometa, and radiation therapy.
- Ribociclib planned with labs monitored per protocol.
- Assess treatment response with symptoms, labs, and imaging every 3 months.
- Proceed with Child Life visit for guidance on communicating with children.
- Acknowledge social work referral; involve palliative care social worker if needed.
- Contact care teams for insurance/cost concerns; do not pay large unexpected costs without notifying team.

Pain
Pain Source: Cancer
Opioid Prescriber: Palliative
Long Acting Opioid (strength/dose/qty): Morphine ER 30 mg BID
Short Acting Opioid (strength/dose/qty): Oxycodone 10-15 mg every 3-4 hours PRN for pain
Adjuvant Meds: methocarbamol 750 mg every 6 hours, Tylenol 1000 mg TID
MED:
PMP Check (08/04/26): Yes

Opioid agreement:signed Yes

DISPOSITION:
RN check in later this week
PC pharm next week
Follow up visit in 3-4 weeks

FUNCTIONAL ASSESSMENT:
ECOG Performance Scale: (1) Restricted in physically strenuous activity, ambulatory and able to do work of light nature
Palliative Performance Scale:
Prognosis: Uncertain of prognosis

Subjective
PALLIATIVE CARE DISCUSSION:
Social History: Lives in Kirkland with husband Mark. 2 children ages 9 and 11. Corporate job. Working full time but planning to take the next month to treat pain and start treatment.
Understanding/Perspective of Illness: Metastatic disease. Treatment is palliative
Hopes, Strengths And What Brings Life Meaning Or Purpose: More time with 2 kids and family. Continuing to work and do the normal things.
Fears, Concerns, Worries: Worries about pain and controlling symptoms
Communication Preferences: Appreciates detail focused information. Uutilizes MyChart, telehealth as appropriate.

IMPORTANT CLINICAL HISTORY:
Imaging: 7/27/26 MRI C-T-L
IMPRESSION

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.
Pathology: 7/24/26 A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Treatment History: Lupron + AI. Awaiting approval for Ribociclib.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

7/29/26 Palliative radiation to C4-T11 800cGy in Fx

Secondary malignant neoplasm of bone (HCC)

RN called patient to get more information.

Regarding her back pain, today, pain is 8-9/10 - a little better than yesterday.

Pt says she is having discomfort in her esophagus, in the center of her chest. She notices this more when swallowing liquids. When the liquid goes down her esophagus, she feels a burning sensation. "It's not preventing me from drinking, but it's a new symptom that I'm noticing."
She didn't notice it when eating her breakfast. She understands to eat softer, more moist food, and avoid drinks that are very hot or very cold.

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0132

Formatting of this note might be different from the original.
Incoming call from Yvonne. She states that she called CVS pharmacy to initiate picking up her first cycle of Ribociclib, however the representative that she spoke with told her that CVS did not have the Rx and that it was routed to Fred Hutch. Upon chart investigation it appears this was routed to CVS and electronically received at 1039 today.

Pt also is wondering when she might expect to have pain improvement from her recent spine radiation. She states that the pain is not worsening, and she might be noticing "micro-improvement" but nothing substantial.

Routed note to pharmacy team for help with investigating Ribo rx, and to RadOnc team for input on back pain improvement timeline.

FRED HUTCH PALLIATIVE CARE NURSE NOTE

VISIT INFORMATION:
Date of Service: 8/7/2026

ID/CC: Pain Management

Participants: Patient

Problem: Pain
Impression: RN call to Yvonne to check in on pain after Amy Brustkern recommended increase of morphine to 30mg TID. Yvonne understood that when she increased Morphine ER to 30mg TID she should reduce oxycodone from 15mg q3hrs to every 4 hours.
Yvonne increased morphine ER 30mg to TID on Wednesday but was unable to reduce oxycodone to 15mg q4hr due to uncontrolled pain.
As she understood it, she reduced morphine ER 30mg back to BID so she could continue oxycodone 15mg q3hr.

I explained that the goal is to be able to reduce oxycodone use after we increase Morphine ER but not at the expense of uncontrolled pain . I explained that she should continue Morphine ER 30mg TID and can utilize oxycodone 10mg-15mg q3-4 hours. I educated to continue to attempt to reduce 1 or 2 doses to oxycodone q4 hr, but not at the expense of uncontrolled pain.
She also shared that while taking Morphine ER 30mg BID with oxycodone 15mg q3 hr - her pain is well controlled, not in pain crisis currently.

Morphine ER 30mg: 12 tabs
Oxycodone 10mg: 118 (taking 12 tabs per day)

EVALUATION AND PLAN:

Nursing Interventions:
Side effect management discussed
Confirmed patient's preferred pharmacy
Refill request sent to provider

Plan:
She will trial increase of Morphine ER 30mg TID this weekend and RN call Monday

Patient/Caregiver Response:
Aware of clinic contact information and States understanding of plan

RN called patient. Communicated information from Dr. John Kang. Asked pt to call in one week to update Dr. Kang about her back pain. Pt agreed to this plan.

Dr. John Kang, 08/07/26:
Up to about 2-3 weeks later I think.
Thanks,
John

Kaci, RN, 08/07/26:
RadOnc team: can you please follow up with Yvonne regarding her back pain? She does not have new or worsening pain, but for peace of mind is hoping to understand a timeline when she might have more noticeable improvement.

RN returned call to Yvonne to give her an update on the Ribo Rx. Our pharmacy team contacted CVS and should be ready to fill soon. Pt will try to call CVS later this afternoon to arrange delivery.

Patient also reports new bilateral rib pain:

Onset: Last night 8/9
Location: Bilateral ribs, right below breast. L side always had "a little bit" of pain, but R side is new.. Now on both sides right underneath breasts.
Severity: 8-9/10
Character: Constant pain. "Hurts a lot". Pt states this feels similar to when she started to have neck pain from known disease as well.

- Denies chest pain
- Denies SOB (can't take a huge deep breath due to back pain, but this is not new)
- Denies any identifiable trigger that seems coorelated to pain onset
- Nothing in particular makes the pain worse or better

Pain management last 24 hours:

- Morphine 30mg TID
- Oxycodone 15mg q 3 hours

Routed to Bronc APP and Pall Care APP for recommendations.

FRED HUTCH PALLIATIVE CARE NURSE NOTE

VISIT INFORMATION:
Date of Service: 8/10/2026

ID/CC: Pain Management and Medication Management

Participants: Patient

Problem: Pain
Impression: Yvonne increased her morphine extended-release to three doses/day and tried to transition to oxycodone q4 hours instead of q3, but has had bilateral rib pain increase. She notified oncology about her increased rib pain. Using 15 mg q3h except at night. Uses 7 doses/day. She did try to increase time between doses to 4 hours a few times over the weekend, but was not able to tolerate it. Functionally managing. Pain is worst when sitting or laying around, "the up-and-down motion makes it worst." Rib pain is also worse at night. Denies increased sedation, somnolence, or nausea. Had a bowel movement yesterday, has regularly about every other day. Using Miralax BID, senna BID, and prune juice.

Pain Source: [X] Cancer [ ] Non-cancer [ ] Peripheral neuropathy [ ] Other
Opioid Prescriber: Palliative care
Long Acting Opioid (strength/dose/qty): morphine extended-release 30 mg TID* Increased from BID at last provider visit 8/4/2026
Short Acting Opioid (strength/dose/qty): oxycodone 10 mg tabs; 10-15 mg q3-4h PRN
Adjuvant Meds: acetaminophen, methocarbamol 750 mg takes twice daily
Total MEDD:
PMP Check (past 30 days):
WA PMP Medication Dispense History (from 5/11/2026 to 8/10/2026)

Dispensed Sold Days Supply Quantity

MORPHINE SULF ER 30 MG TABLET 7/30/2026 No sold data 14 28 unspecified

OXYCODONE HCL (IR) 10 MG TAB 7/30/2026 No sold data 14 170 unspecified

OXYCODONE HCL (IR) 5 MG TABLET 7/17/2026 No sold data 8 100 unspecified

ACETAMINOPHEN-COD #3 TABLET 7/14/2026 No sold data 5 20 unspecified

ALPRAZOLAM 0.25 MG TABLET 7/10/2026 No sold data 30 30 unspecified

Pill counts: morphine extended-release - 6 tabs
Oxycodone ~80 tabs, uses 10/day
Methocarbamol 750 mg - few days left

EVALUATION AND PLAN:

Nursing Interventions:
Side effect management discussed
Reviewed prescribed medication instructions
Confirmed patient's preferred pharmacy
Refill request sent to provider
Provider contacted

Plan:
Per Kim Harlow, ARNP:
Increase morphine extended-release to 45 mg q8h, prescriptions sent to pharmacy
RN follow up later this week
Yvonne will call with any questions or concerns meanwhile

Patient/Caregiver Response:
Aware of existing appointments, Aware of clinic contact information, and Restates plan

RN call to CVS Specialty Pharmacy. Verified pt identifiers. Call transferred to Pharmacist, Ben. Asked for clarification on what is needed for medication to be shipped to pt, as team has not encountered pharmacy asking for EKG before. RN relayed to Ben that labs, EKG, and education visit will be completed prior to pt starting Ribociclib (Kisqali), though dates are not set at this time. Ben advised that with team's confirmation that labs and EKG will be done, they can ship medication. Estimated delivery date 8/14. RN confirmed that pharmacy is not requesting copy of EKG at this time. They will reach out to FHCC team if this is needed.

CHILD LIFE NOTE

VISIT INFORMATION

Referral from: Provider - Lynn Symonds, MD

Reason for Visit: Adult Consult

Encounter Type: Phone

Location: SLU

Present at Encounter: Patient and Spouse, Mark

Ages of Children: 9.5yo son, Cooper, and 11.5yo daughter, Kenzie (turns 12yo around Thanksgiving)

Visit Type: Initial

Patient Type (Diagnostic/Treatment Team): Breast BRONC (Breast Oncology)
Diagnosis per chart, "Breast cancer metastasized to bone, unspecified laterality"

Interventions: Introduce services
Psychosocial education related illness, treatment, or hospitalization
Emotional support

This Certified Child Life Specialist (CCLS) received referral and spoke with Pt and Pt's husband, Mark on the phone to provide resources and guidance on conversations to support Pt's children. This CCLS introduced self and services. Pt expressed interest in child life resources and open and receptive to ideas and conversations regarding this topic with children. Pt share finding out about diagnosis in July, children know that Pt has been dealing with back pain, and Pt and Mark hoping to tell children regarding diagnosis soon. This CCLS talked with Pt regarding ways to start and continue the conversations, as well as provided scripts for potential questions that children may ask. This CCLS listened and provided ideas verbally, items to consider, as well some links and resources via e-mail to facilitate coping and adjusting to caregiver illness, including supportive community organizations, camps, etc. Pt expressed appreciation.

Evaluation/Plan: For future child life referrals, contact the supportive care scheduling line at 206-606-5890.

Time Spent:

Direct: 45min

Indirect: 15min

Total: 60min

FRED HUTCH PALLIATIVE CARE NURSE NOTE

VISIT INFORMATION:
Date of Service: 8/11/2026

ID/CC: Medication Issue

Participants: Patient and Medical personnel Laura, Safeway Pharmacy

Problem: Prescription / Pharmacy Issue
Impression: Received secure chat from ACE provider reporting that Yvonne's husband had called them directly saying the pharmacy would not dispense Yvonne's morphine ER and she was out. I contacted Laura, the pharmacist at Safeway, who stated that she was aware there is a dose increase and that she spoke with the patient earlier and told her that she was preparing both morphine extended-release prescriptions for pickup. Confirmed no PA required, but pharmacist did require a chart note even with Yvonne's cancer diagnosis. RN sent most recent palliative care provider and RN note per pharmacist request. Called Yvonne and Mark and informed them pharmacy is preparing both for pickup. Advised to contact the pharmacy for any additional questions about picking up.

EVALUATION AND PLAN:

Nursing Interventions:
Confirmed patient's preferred pharmacy
Pharmacy contacted

Plan:
Waiting on response from provider

Patient/Caregiver Response:
Aware of existing appointments, Aware of clinic contact information, and States understanding of plan

Electronically signed by Amy C at 08/11/2026 4:45 PM PDT

Telephone Encounter - Megan D - 08/12/2026 9:43 AM PDT

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0122

Formatting of this note might be different from the original.
RN call to Yvonne following MCM. She continues to have pain in her ribs, despite pain medication escalation with palliative care team. She picked up increased morphine prescription last night and has taken two doses of the 45mg Morphine ER - first last night, then again this morning (increase discussed in 8/10 telephone note). She continues to use 15mg Oxycodone q3h. Plan is to decrease oxy use with increased dose of morphine, though she has not been able to do this yet due to pain levels.

Yvonne's pain is mostly in the ribs - L side is more painful than R but there's pain in both. Her neck and back pain improved a little after radiation, with most improvement noted in her neck. She has some pain on the R side of her throat with swallowing, though this may be due to recent radiation. She has a throat spray from Dr. Kang but will let us know if she needs additional medication for throat pain - discussed swish/swallow options.

We discussed option for ACE visit, per team discussion earlier this week. Potential for Chest CT to r/o other causes of pain. Yvonne is open to ACE visit and we discussed the process for ACE referrals. Her husband will drive her to ACE visit if approved. Their ideal timing is between 12:30-2, but they can be flexible if she is able to be seen.

Yvonne denies SOB and fever. No systemic symptoms. She is using bowel medications and having BM once a day or every other day. She does feel bloated most of the time but denied abd pain. Nausea is controlled with home PRN antiemetics.

Plan for RN follow up with ACE and return call to Yvonne either via RN or ACE team.

Spoke with Sam Doyle, ARNP. Their team will reach out to Yvonne to schedule at ACE 8NE.

oxyCODONE tablet 15 mg 08/12/2026 15:32 Given 15 mg Oral Yuzvyak, Irina, RN

Ordering Provider: Sutanthavibul, Parisa, ARNP

NDC: 0406-0552-23, 0406-0552-23, 0406-0552-23

Lot#: , ,

Comments: pain 6/10

Assessment and Plan:

Hand off: No

Discharge:
Patient tolerated treatment well and without complications.
Discharge disposition:
Accompanied by: Self and Family
Discharged to: Home
Response: States understanding of plan
Preferred language: English
Interpretation/Language Services: No interpreter

Summary: Patient arrived to the clinic with her husband, reporting severe rib pain 6/10 (after taking pain medications at home) related to tumor metastasis. Pt is on palliative care. AC PIV 20G placed with a second attempt, tolerated well. Labs collected: CBC/CMP. Pt underwent CT w contrast, stated that flashing and contrast injections at CT were painful. Pt ordered/given Oxycodone 15 mg and Morphine 45 MG PO with moderate reduction in pain. Please review CT result per request. Pt VS stable, released home accompanied by her husband. Palliative care manages pain regimen.

Additional documentation may exist in Flowsheets or Education Activity

FHCC ACUTE CLINICAL EVALUATION (ACE) CLINIC NOTE

ONCOLOGY CARE TEAM
Patient Care Team:
Purcell, William Thomas, MD as Oncologist (Hematology-Oncology)
Symonds, Lynn Katherine, MD as Oncologist (Hematology-Oncology)

IDENTIFICATION/CC
Yvonne Kalley Franklin is a 47 year old female with a diagnosis of breast cancer metastasized to bone currently on hormone therapy with monthly leuprolide IM last dose 7/29, anastrozole 1 mg daily, and Zometa 4 mg infusions every 3-4 weeks (last dose 7/30). Last XRT on 7/29. She presents today for recurrent rib pain (L>R) x3 days.

CURRENT TREATMENT

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/17/2026 (Planned)

End Date 11/9/2026 (Planned)

TREATMENT HISTORY

Oncology History Overview

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving

T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

7/29/26 Palliative radiation to C4-T11 800cGy in Fx

INTERVAL HISTORY
Yvonne was referred by the primary oncology team for recurrent rib pain (L>R) x3 days. Analgesia doses were recently increased by Palliative Care, which she started taking last night (Morphine ER 45 mg q8H and Oxycodone 15 mg q3H PRN pain). Last dose Morphine ER 45 mg was at 08:00. Previously Oxycodone 15 mg q3H PRN would wear off at 2 hours, but today she was able to space it out by 4 hours (last taken at 08:00, then at 12:00). The pain goes up to 10/10 with moving or twisting her upper body and is positional when laying in bed. At rest, it is 4/10. Pain prevents her from taking a deep breath. No dyspnea, although she feels like she is "working harder" with activity.

She has pain r/t metastatic lesions along her spine and left side ribs, including pathological compression fractures and a left side rib fracture. The neck and back pain improved after XRT, however she recently noticed the rib pain return bilaterally saying, "It feels like broken ribs on both sides."

She is also having pain on the right side of her throat with swallowing d/t recent XRT. She has a throat spray and lidocaine, although is unsure how to use the lidocaine (swishing/spitting vs. swallowing). The pain is not affecting her oral intake. Denies moist coughing or choking after eating/drinking.

Nausea is relieved by Compazine, no vomiting. She did not take Compazine today and denies nausea. Denies fever, chills, cough, chest tightness, chest pain, difficulty swallowing, nausea, vomiting, changes in appetite, changes in bladder/bowel habits. She takes Senna for constipation, last bowel movement was last night. She is accompanied by her husband, Mark.

REVIEW OF SYSTEMS
Pertinent positives noted in above HPI, otherwise negative ROS.

PROBLEM LIST

Active Ambulatory Problems

Diagnosis Date Noted

- Secondary malignant neoplasm of bone (HCC) 07/22/2026
- Neck pain 07/27/2026
- Cancer related pain 07/27/2026
- Breast cancer metastasized to bone, unspecified laterality (HCC) 07/27/2026
- Acute bilateral thoracic back pain 07/28/2026
- Pathologic compression fracture of vertebra (HCC) 07/28/2026
- Metastatic malignant neoplasm (HCC) 07/28/2026
- Cancer, metastatic to bone (HCC) 07/28/2026

Resolved Ambulatory Problems

Diagnosis Date Noted

• No Resolved Ambulatory Problems

Past Medical History:

Diagnosis Date

• Breast cyst Always

PHYSICAL EXAMINATION
VITAL SIGNS: BP 119/80 (Patient Position: Sitting) | Pulse 82 | Temp 37.2 °C (Oral) | Resp 16 | SpO2 96%
Physical Exam
Constitutional:
General: She is not in acute distress.
Appearance: Normal appearance. She is not ill-appearing or toxic-appearing.
Cardiovascular:
Rate and Rhythm: Normal rate and regular rhythm.

Pulses: Normal pulses.
Heart sounds: Normal heart sounds.
Pulmonary:
Effort: Pulmonary effort is normal. No respiratory distress.
Breath sounds: Normal breath sounds. No stridor. No wheezing, rhonchi or rales.
Chest:
Comments: Rib pain is bilateral (L>R) anteriorly under each breast that radiates laterally. No rib pain posteriorly. Both L & R side anterior ribs under the breast protrude slightly outward with palpable lesions. There is tenderness with palpation.
Abdominal:

Palpations: Abdomen is soft.
Neurological:
Mental Status: She is alert.

IMAGING/PERTINENT STUDIES
CTA Chest PE w Contrast

Narrative: EXAMINATION:
CTA CHEST PE W CONTRAST: PULMONARY EMBOLISM PROTOCOL

CLINICAL INDICATION:
ACE: 47yoF breast ca with mets to bone, worsening bilateral rib pain L>R anterior and lateral sides. Conern for metastatic lesions vs. PE.

TECHNIQUE:
CTB C3 CTA Chest Suspected pulmonary embolus.
Contiguous axial sections were obtained through the chest with IV contrast. Multiplanar reformatted images were performed. Axial MIPs were generated on the CT scanner console. Automated exposure control and statistical iterative reconstruction techniques substantially lowered patient radiation dose.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,50 mL Intravenous,08/12/2026 1550

COMPARISON:
CT chest on 7/13/2026.

FINDINGS:
Pulmonary artery findings: No evidence of acute pulmonary embolism.
The RV/LV ratio is less than 1, indicating no right ventricular pressure overload.

Supraclavicular region: Unremarkable.
Mediastinum: Unremarkable.
Heart: Unremarkable.
Lungs: Left greater than right small lower lobe consolidations. Bronchial wall thickening an scattered mucous plugging. Similar solid pulmonary nodules, for example 4 mm in the left lower lobe (305/177). No new or enlarging pulmonary nodules.
Pleura: Unremarkable.
Chest wall: Unremarkable.
Upper abdomen: Limited pulmonary arterial phase views of the upper abdomen are unremarkable.
Bones:

* Multiple lytic lesions within the bilateral ribs, spine, and sternum, are probably increased when compared to prior.
* Multiple new and/or worsening pathological compression fractures involving the T1, T5, and T8 vertebral bodies (602/56). There is 2 mm of retropulsion of the T5 vertebral body (602/56) and minimal retropulsion of the T8 vertebral body.
* Increased fracture of the T12 vertebral body now involving more of the inferior endplate (602/54). New pathologic fracture of the T10 inferior endplate (602/55).
* Left 9th rib lytic lesion with soft tissue component measuring 3.0 x 1.8 cm (305/150) previously 2.7 x 1.6 cm. Multiple chronic pathologic rib fractures. New subacute fracture of the left 7th rib (305/131).
* Multiple lytic rib lesions involve the cortex, for example (304/133, 304/68, 304/86).
Impression:
1. No evidence of acute pulmonary embolism.
2. Multiple lytic lesions as above, which have increased compared to prior. There are multiple new/worsening pathologic compression fractures involving the multiple thoracic vertebral bodies as above. Mild retropulsion of the T5 and T8 vertebral body fractures.

3. Multiple lytic rib lesions many of which involve the cortex. Increase in size of soft tissue component of the left 9th lytic rib lesion. New subacute fracture of the left 7th rib.
4. Left greater than right small lower lobe consolidations, likely atelectasis. Superimposed aspiration can't be excluded.
5. Similar solid pulmonary nodules. No new or enlarging nodules. Consider follow-up per oncology protocol.

ASSESSMENT/PLAN
Yvonne Kalley Franklin is a 47 year old female with a diagnosis of breast cancer metastasized to bone currently on hormone therapy with monthly leuprolide IM last dose 7/29, anastrozole 1 mg daily, and Zometa 4 mg infusions every 3-4 weeks (last dose 7/30). Last XRT on 7/29. She presents today for recurrent rib pain (L>R) x3 days.

Yvonne is A/O x4, not in acute distress, and not toxic-appearing. At rest, pain level is tolerable at 4/10. Vital signs are stable: temp 37 C, BP 115/76, HR 84, RR 16, 98% on room air.

Labs notable for Hct 35, but is overall improving compared the past several weeks. Other labs unremarkable.

Recurrent rib pain, L>R

Differential diagnoses include, but are not limited to, disease-related pain r/t lytic lesions, costochondritis, or PE. Considered cardiac etiology, but patient does not have chest pain, chest tightness, or dyspnea. Although patient has a low risk Well' Score, will order CTA chest PE as patient reported the feeling of "working harder" with activity. However, more suspicious for disease-related pain given prior imaging and patient's clinical picture.

CT negative for PE. However, there was evidence of worsening disease including new/worsening pathologic compression fractures, increased size of the L 9th lytic rib lesion, a subacute fracture of the L 7th rib, and multiple diffuse lytic lesions within bilateral ribs/spine/sternum. These findings are consistent with the patient's report of pain. Findings discussed with patient and husband, which prompted further questions about starting treatment more urgently and other options such as XRT to the ribs. Recommend following up with the primary oncology team.

Throat pain, right

Patient reports mild pain with swallowing after XRT. It is not affecting her oral intake or ability to swallow safely. Answered patient's questions regarding how to use the lidocaine as swishing and spitting will not help her throat pain. We discussed it is OK to swallow the lidocaine for throat pain as directed: "Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat)." Patient verbalizes understanding.

Considering findings from today's work-up not necessitating urgent transfer to a higher level of care, the patient remains afebrile with stable vital signs, and is not in acute distress, the plan is to discharge home and follow-up with the primary oncology care team.

Yvonne is in agreement with the plan and feels comfortable with discharge home. She reports understanding of Urgent and ED precautions for worsening signs and symptoms or other acute changes. After-hours contact information provided for any urgent questions. Aware of the need for follow-up with primary oncology team related to today's acute visit. Understanding of the plan of care above verified by teach back.

Plan

- CTA chest PE --> negative for PE, but showed worsening disease (see report above)
- Morphine ER 45 mg and Oxycodone 15 mg x1 dose each to stay on home schedule --> reports pain is tolerable and declined additional analgesia
- OK to DC home

- Message sent to team for follow-up

Diagnosis: The primary encounter diagnosis was Breast cancer metastasized to bone, unspecified laterality (HCC). Diagnoses of Cancer related pain and Rib pain were also pertinent to this visit.
Condition: Stable
Disposition: Home

The patient discharged from clinic by private vehicle with her husband

TIME STATEMENT
Total time spent on the care of this patient was 60 minutes including reviewing records and prior test results; face-to-face evaluation and physical examination; ordering tests, medications, imaging, or procedures and interpreting results; documentation of medical decision making; patient, family, and caregiver education and counseling of diagnosis, treatment options, and plan of care; coordination of care; and communication with other healthcare professionals.

Telephone Encounter - Megan D - 08/13/2026 3:34 PM PDT

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0116

Formatting of this note might be different from the original.
RN call following ACE visit yesterday. Yvonne feels that new pain regimen is working a lot better. She is taking Morphine ER 45mg and has oxy 10-15mg q3h PRN. She was previously feeling oxy wear off after about 2 hours but after increasing morphine, has spaced out use of oxy to q4h two times.

We discussed communication with RadOnc team following imaging yesterday. Yvonne is not clear on the imaging results from ACE visit and whether lesions were on both sides of ribs previously. I reviewed conversation between Dr. Symonds and team that radiation to ribs can cause ribs to be more fragile, so is generally avoided unless needed for symptom management.

Ribociclib (Kisqali) is due to be delivered tomorrow. I reviewed need for provider visit, EKG, labs, RN education visit before starting. Yvonne is currently scheduled for these on 8/19 but is open to accelerating timing to get started on medication. Plan for RN follow up with team to discuss required visits and timing. RN or PCC will follow up with Yvonne regarding any changes to schedule.

FHCC PALLIATIVE CARE NOTE

VISIT INFORMATION:
Date of Service: 8/14/2026
Type of Visit: Phone Call Visit
Referral Reason: Cancer-related pain, Symptom management (non-pain), and Emotional support/coping

ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole. Awaiting start of ribociclib. ACE visit 8/12/26 for increased pain.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/15/2026 (Planned)

End Date 11/7/2026 (Planned)

Addressed during this visit: Patient's narrative, Symptom management, Optimizing quality of life, and Education about palliative care
Participants: Patient and Spouse: Mark

History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with metastatic stage IV invasive lobular breast cancer with osseous metastases who presents today for follow up phone visit.

Pain control has been variable. Rib pain is most bothersome, worsened by movement and breathing. Back pain is also present and responds better to opioids. Since increasing morphine ER to 45 mg three times daily, overall pain control has improved, with longer breakthrough relief and occasional ability to go up to 4 hours between oxycodone doses rather than needing redosing around 2-3 hours. Breakthrough opioid is oxycodone 15 mg per dose; she has not increased to 20 mg. She was seen in the ACE clinic on Wednesday 8/12/26 for marked rib pain and had a CT scan given known rib lesions and a change in pain.

She is starting ribociclib today 8/14/26. Radiation oncology follow-up is scheduled next week. After speaking with Dr. Simons' nurse on 8/13/26, she understands that radiation to the ribs is unlikely to be pursued, but she plans to keep the appointment.

Bowel movements over the last week have generally been once daily or every other day, with multiple bowel movements yesterday. Stools have been soft and pasty rather than formed, which is atypical. Marked bloating persists with a sensation of incomplete evacuation even after a seemingly adequate bowel movement.

Oral intake is limited by poor appetite and difficulty tolerating heavier foods; she is managing smaller, softer meals such as soups, smoothies, avocado toast with egg, and yogurt with fruit. Nausea has been variable. Prochlorperazine is being used; ondansetron has not been taken. A strong wave of nausea occurred last night with near-emesis but no vomiting, and symptoms have otherwise been fairly controlled.

Goals of Care

She described the past weeks as a roller coaster and expressed hope that starting ribociclib today will be a major turning point for symptom control, describing it as promising and sharing high hopes. I shared my hope that cancer-directed therapy may improve pain and related symptoms, while also setting expectations that response can vary and may take several weeks to months even if some people notice earlier improvement.

She shared that Mark is helping her stay on top of eating and that she is focusing on protein and calories with smaller, softer meals. She described Child Life support as very helpful and reported that she and Mark talked with their children about the cancer this week, which felt emotionally relieving despite being hard, and she anticipates more questions from their daughter.

We discussed barriers related to opioid access and pharmacy and insurance processes. She and Mark voiced worry about running out early if dosing changes and described a recent distressing interaction with a pharmacist when attempting to fill an adjusted prescription, which left her feeling stigmatized. I reviewed how dose changes require updated prescription instructions for pharmacy and insurance coverage, encouraged her to notify my team if she needs more frequent or higher breakthrough dosing, and emphasized contacting us rather than independently changing long-acting morphine.

Assessment & Plan

Cancer pain management

Cancer-related pain improved with morphine ER and less frequent oxycodone use, but persistent rib pain remains. Ribociclib initiated with expected symptom improvement. Radiation Oncology follow-up planned, though rib radiation may not be optimal.

- Continue morphine ER 45 mg PO TID.
- Use oxycodone IR 15 mg PO q3-4h PRN for breakthrough pain; may increase to 20 mg per dose PRN if pain worsens.
- Do not adjust morphine dose without contacting palliative care team.
- Contact palliative care team if oxycodone is needed more frequently or if consistently requiring 20 mg, to reassess and update prescription dosing.
- Follow up with Radiation Oncology next week to discuss additional radiation.
- Start ribociclib today; counseled on potential pain improvement timeline.
- Send morphine refill request in 1 week to prevent running out before next visit.
- Contact palliative care team next week for uncontrolled or worsening pain.

Nausea and decreased appetite

Intermittent nausea with one severe episode, no emesis. Appetite reduced, prefers small, soft meals. Using prochlorperazine PRN, not taking ondansetron. Will reassess after starting ribociclib. Olanzapine may be considered if symptoms persist.

- Continue prochlorperazine PRN for nausea.
- Use ondansetron PRN for acute or severe nausea; may use scheduled if nausea becomes frequent.
- Reassess nausea and appetite after starting ribociclib.
- Consider olanzapine if persistent decreased appetite or nausea.

Opioid-induced constipation

Bowel movements daily to every other day with pasty stool consistency and persistent bloating. Meeting frequency goal but with sensation of incomplete evacuation.

- Maintain bowel movement goal of every 1-2 days.
- Add fiber supplement to increase stool bulk and assess response.
- Prioritize protein and caloric intake; use fiber supplement rather than major dietary changes if intake is limited.
- If bowel movements decrease to every 2-3 days after adding fiber, reduce or discontinue fiber supplementation.

Pain
Pain Source: Cancer
Opioid Prescriber: Palliative
Long Acting Opioid (strength/dose/qty): Morphine ER 45 mg TID
Short Acting Opioid (strength/dose/qty): Oxycodone 10-15 mg every 3-4 hours PRN for pain
Adjuvant Meds: methocarbamol 750 mg every 6 hours, Tylenol 1000 mg TID
MED: 250
PMP Check (08/04/26): Yes

Opioid agreement:signed Yes

DISPOSITION:
Follow up visit in 2 weeks

FUNCTIONAL ASSESSMENT:
ECOG Performance Scale: (1) Restricted in physically strenuous activity, ambulatory and able to do work of light nature
Palliative Performance Scale:
Prognosis: Uncertain of prognosis

Subjective
PALLIATIVE CARE DISCUSSION:
Social History: Lives in Kirkland with husband Mark. 2 children ages 9 and 11. Corporate job. Working full time but planning to take the next month to treat pain and start treatment.
Understanding/Perspective of Illness: Metastatic disease. Treatment is palliative
Hopes, Strengths And What Brings Life Meaning Or Purpose: More time with 2 kids and family. Continuing to work and do the normal things.
Fears, Concerns, Worries: Worries about pain and controlling symptoms
Communication Preferences: Appreciates detail focused information. Uutilizes MyChart, telehealth as appropriate.

Brustkern, Amy K, PA-C as Physician Assistant (Palliative Medicine)

IMPORTANT CLINICAL HISTORY:
Imaging: 7/27/26 MRI C-T-L
IMPRESSION

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.
Pathology: 7/24/26 A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Treatment History: Lupron + AI. Awaiting approval for Ribociclib.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving

T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

Not completed today as phone visit.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, audio only conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: Partner

I spent a total of 35 minutes for the patient's care on the date of the service.

Current Outpatient Medications:

- acetaminophen 325 MG tablet, Take 3 tablets by mouth every 8 hours. (Patient not taking: Reported on 7/31/2026), Disp: , Rfl:
- albuterol HFA 108 (90 Base) MCG/ACT inhaler, Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing., Disp: , Rfl:
- anastrozole 1 MG tablet, Take 1 tablet by mouth daily., Disp: 30 tablet, Rfl: 0
- cholecalciferol 50 mcg (2,000 unit) capsule, Take 2 capsules by mouth daily., Disp: , Rfl:
- lidocaine viscous 2 % mouth/throat solution, Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat)., Disp: 200 mL, Rfl: 1
- methocarbamol 750 MG tablet, Take 1 tablet by mouth every 6 hours as needed for muscle spasms., Disp: 30 tablet, Rfl: 0
- morphine ER 15 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours, Disp: 42 tablet, Rfl: 0
- morphine ER 30 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours, Disp: 42 tablet, Rfl: 0
- naloxone 4 MG/0.1ML nasal spray, Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril. (Patient not taking: Reported on 7/31/2026), Disp: 2 each, Rfl: 0
- ondansetron 8 MG tablet, Take 1 tablet by mouth every 8 hours., Disp: 90 tablet, Rfl: 0
- oxyCODONE 10 MG tablet, Take 1-1.5 tablets by mouth every 3 hours as needed for moderate pain., Disp: 170 tablet, Rfl: 0
- pantoprazole 40 MG EC tablet, Take 1 tablet by mouth daily on an empty stomach., Disp: 20 tablet, Rfl: 0
- polyethylene glycol 3350 17 g packet, Take 1 packet by mouth daily. Dissolve in 4-8 ounce water., Disp: , Rfl:
- prochlorperazine 10 MG tablet, Take 1 tablet by mouth every 6 hours as needed for nausea/vomiting., Disp: 50 tablet, Rfl: 0
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:

- ribociclib (600 mg dose) 200 MG tablet therapy pack, Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days. Do not take first dose until directed by clinical team., Disp: 63 tablet, Rfl: 0
- senna 8.6 MG tablet, Take 2 tablets by mouth 2 times a day., Disp: 120 tablet, Rfl: 0
- tretinoin 0.025 % cream, Apply 1 application topically 3 times a week. Apply to face., Disp: , Rfl:

BREAST ONCOLOGY NEW PATIENT VISIT

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

ID/CC: 47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease, who presents today for initiation of ribociclib.

ONCOLOGY HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma

-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

8/15/26: Start Ribociclib

HPI: Please see detailed oncology history above. We spent the majority of the visit reviewing the diagnosis and discussing treatment recommendations. Please see details in the assessment and plan.

History of Present Illness
Yvonne Kalley Franklin is a 47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease, currently on leuprolide and anastrozole with zoledronic acid, who presents for follow-up and initiation of ribociclib.

Since her last visit, she was evaluated in the ACE clinic on 8/12/26 for worsening rib pain, L>R. Her pain regimen was recently increased to morphine ER 45 mg every 8 hours with oxycodone 15 mg every 3 hours PRN. She reports improved pain control with the adjusted regimen and has been able to extend the interval between oxycodone doses, although she continues to have persistent pain involving the neck, upper back, and ribs, exacerbated by movement, deep inspiration, and coughing. She feels the pain remains suboptimally controlled and describes it as gradually “spreading.” She notes some drowsiness related to her analgesics and continues to have constipation despite supportive measures, as well as chronic bloating.

She otherwise reports intermittent sore throat/odynophagia and uses topical anesthetic as needed with oral intake. She denies new lymphadenopathy, headaches, vision changes, new abdominal pain aside from rib-related discomfort, new lower-extremity bone pain, numbness/tingling, or abnormal bleeding.

She also notes bilateral breast soreness/fullness, more prominent on the left near the site of her prior biopsy, with associated tenderness and discomfort when wearing a bra. She has not appreciated any other new breast changes.

ROS: Complete ROS was reviewed and was negative unless stated above in the HPI

ECOG: 0 (prior to diagnosis)

PMH
Medical History

Gynecology History:
Menopausal Status: premenopausal
HRT use: Denies
OCP use: Yes, from 18-33 then had IUDs (IUD recently removed)

PHYSICAL EXAM

Vitals:

08/14/26 1013

BP: 124/85

Pulse: 88

Resp: 14

SpO2: 97%

PHYSICAL EXAM:
Constitutional: Looks well, no acute distress
HEENT: Normocephalic, atraumatic. PERRL, EOM intact, sclera anicteric. Tenderness over posterior neck.
Lymph nodes: No cervical or axillary lymphadenopathy
Breast: Left breast with a palpable ~1 cm mass and generalized lumpiness extending from the upper outer to lower outer quadrant, nontender. No overlying skin changes. Nipple everted without discharge or other abnormality. Right breast without palpable masses or skin changes. Nipple everted without discharge or other abnormality.
Cardiovascular: Regular rate and rhythm with no murmurs
Respiratory: Lung fields clear to auscultation bilaterally. Tenderness over the posterior ribcage and the bilateral costal margins.
Abdomen: Soft, non-distended, non-tender, normoactive bowel sounds

Extremities: No edema BLE, normal ROM
Skin: Warm and dry
Neurologic: Alert and oriented x3
Psychiatric: Negative

IMAGING
Imaging was reviewed and summarized above in the oncology history

PATHOLOGY

Left Breast Core biopsy and Right axillary lymph node 7/22/26 (copied from report)
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

TUMOR

Tumor Site Clock position

1 o'clock

Tumor Site Distance from nipple (Centimeters): 7 cm

Histologic Type Invasive carcinoma with features of: lobular

Histologic Grade (Nottingham Histologic Score)

Glandular (Acinar) / Tubular Differentiation Score 3

Nuclear Pleomorphism Score 2

Mitotic Rate Score 1

Overall Grade Grade 2 (scores of 6 or 7)

Largest Invasive Focus in this Limited Biopsy Sample 7 mm

Ductal Carcinoma In Situ (DCIS) Not identified

Lymphatic and / or Vascular Invasion Not identified

Microcalcifications Not identified

Breast Biomarker Studies (pending) Biomarkers have been ordered and will be reported in an addendum.

Testing Performed on Specimen / Block Number(s) A1

Test(s) Performed

Estrogen Receptor (ER) Status Positive (greater than 10% of cells demonstrate nuclear positivity)

Percentage of Cells with Nuclear Positivity 91-100%

Average Intensity of Staining Strong (3+)

Test(s) Performed

Progesterone Receptor (PgR) Status Positive

Percentage of Cells with Nuclear Positivity 91-100%

Average Intensity of Staining Strong (3+)

Test(s) Performed

HER2 by Immunohistochemistry (IHC) Status Negative (Score 1+)

Incomplete membrane staining that is faint / barely perceptible and in greater than 10% of tumor cells

Test(s) Performed

Ki-67 Proliferative Index 21-30%

ASSESSMENT/PLAN: 47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease, who presents today for initiation of ribociclib.

#Breast Cancer: Patient presented with several months of back pain. An MRI on 7/1/26 showed expansile lesions in T1, T5, T8-T10. Subsequent CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout the spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules. PET CT on 7/21/26 showed FDG avid lesions in L breast, R axilla, and bones. Left breast core biopsy on 7/22/26 showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30%. Right axillary

LN biopsy showed metastatic carcinoma. Right iliac crest biopsy also showed metastatic carcinoma. She was subsequently admitted for pain control and started on lupron + anastrozole. As previously discussed, this presentation is consistent with metastatic/stage IV breast cancer and recommendation is for AI + CDK4/6 inhibitor as first-line systemic therapy. Given the side effect profile, decision was made to proceed with ribociclib. She presents today for initiation of ribociclib. Labs are adequate to proceed. We reviewed potential side effects of ribociclib including neutropenia/decreased blood counts, LFT changes, fatigue, QTc prolongation, and rare pneumonitis.

- Reviewed baseline EKG, QTc <450 ms.
- Start ribociclib 600 mg PO daily D1-21 of a 28-day cycle.
- Continue lupron q4 weeks.
- Continue anastrozole daily.
- Repeat labs and EKG in 2 weeks.
- Repeat CT Cap and PET/CT on 11/13/2026.
- Referrals placed for Nutrition, SW, and Child Life.
- Will send next-generation sequencing on tumor sample.
- Continue follow-up with Palliative Care.

#Pain management: Persistent cancer-related pain involving the neck, upper back, and ribs in the setting of extensive osseous metastatic disease. She was recently evaluated in ACE clinic for worsening rib pain. Since adjustment of her pain regimen, she reports improved pain control and has been able to extend the interval between breakthrough oxycodone doses, though pain remains present.

- S/p palliative RT.
- Continue MS Contin 45 mg every 8 hours.
- Continue oxycodone 15 mg every 3 hours PRN breakthrough pain.
- Continue Tylenol PRN.
- Continue supportive medications as directed by Palliative Care.
- Recommend daily bowel regimen given opioid-induced constipation.
- Continue follow-up with Palliative Care for ongoing symptom management.

#Bone Mets: We previously discussed the data supporting the use of bisphosphonates in patients with bone metastases to prevent skeletal-related events and decrease pain. The risk of ONJ and atypical femur fractures is low at the doses/frequency used in this setting. Common side effects include arthralgias and transient flu-like symptoms following infusion.

- Continue Zometa q4 weeks.

#Radiation-associated odynophagia: Reports intermittent sore throat/discomfort with swallowing following recent radiation, currently manageable with supportive measures.

- Continue topical lidocaine/throat spray PRN.
- Encourage hydration.
- Monitor for worsening dysphagia/odynophagia or decreased PO intake.

#Genetics: Genetic testing recommended in the setting of metastatic breast cancer.

Disposition: RTC 2 weeks after starting of ribociclib for review labs, EKG and provider visit.
Advised to contact the clinic with any questions or concerns in the interim.

To patients reading this note: Please be advised that the primary purpose of this note is for me to communicate other members of your medical team. Standard sentence structure is not always used. Medical terminology, abbreviations and acronyms may be used that are unfamiliar.

Oral Treatment Education Initial

Yvonne Kalley Franklin is a 47 year old female receiving education prior to the start of therapy. This visit was conducted in person. Pt's brother was present for visit

Treatment Regimen/Clinical Trials Protocol: Ribociclib

Education Assessment
Learner(s): Patient and Family
Readiness: Acceptance
Method: Literature and Explanation
Barriers: None

Medication Education
Planned Start Date: 8/14/2026
Education has been provided and understanding was confirmed on the following topics: Indications and goals of treatment, When and how to call care team/emergency services, Start date, administration schedule, and duration of therapy, Contraindications (e.g., avoiding pregnancy), Common and high-risk side effects, Side effect prevention and management (e.g., pre-meds, supportive care meds), Reporting new or changed medications or

supplements, Medication storage and disposal, Missed dose management, Safe handling of medication and Safe handling of bodily fluids
Additional education topics discussed: Reproductive risks and protection, Management of unused medication, Food and drug interactions and Supportive care resources
Medication-Specific Written material provided: Fred Hutch-created and ONS/HOPA
Additional Written material provided: Clinic contact information and Symptom sheet(s)
Post Education Response: Teach back - restates info with assist
Time Spent: 60 minutes

?
Nurse Education Visit for Zoledronic Acid (Zometa) Education
Treatment Education:
Planned Start Date: Pt received first dose while inpt. First dose at FHCC planned for 8/28

Medication Schedule: Every 4 weeks

Action: Strengthens bones by reducing the amount of calcium released from your bones. Can be used to treat or prevent bone metastasis.

Need dental check before start and let team know if planning on any invasive dental work

Common Side Effects:

Flu like symptoms typically with first infusion

Mild nausea

Fatigue

Constipation

Can affect your Cr (kidney function)

Rare but Serious Side Effect: Damage to bone tissue in the jaw

How to Manage the Side Effects:

2 liters of fluids day before, day of and day after infusion help flush your kidneys and reduce flu like symptoms.

Take calcium and Vit D supplements per provider recommendation

Let us know if experiencing flu-like symptoms and we can help you manage the symptoms

Acetaminophen (if approved by provider) after administration may reduce the incidence of acute reaction (eg, arthralgia, fever, flu-like symptoms, myalgia)

Let provider know before having any dental procedures, including tooth removal

Nurse Education Visit for Lupron
This visit was conducted in person. Pt's brother was present for visit.

Medication Information Discussed:

- Medication administration and schedule: IM injection every 4 weeks
- Action: Suppress estrogen production by the ovaries.
- Handouts provided: Lupron regimen sheet, Ovarian Suppression Therapy with Lupron handout and Menopause Without Hormones handout.

We discussed common side effects including hot flashes, changes in metabolism, headache, joint/muscle pain, fatigue, mood changes, decreased libido, vaginal dryness, and decreased bone density. We also discussed the rare but serious side effect of changes in cardiac function. We discussed side effect management and when to contact the team (contact information provided), as well as when to present to the emergency room. All questions were answered.

Patient Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, and No further questions

Patient Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, and No further questions

RN follow up:

Awaiting scheduling for Oncology Nutrition Visit

Referral placed to Integrative Medicine

Plan to discuss potential for EGD with dilation with provider team.

Oncology Telephone Triage Note

Subjective / Visit Information:

Reason for Call: Triage (Uncontrolled Nausea after first dose Ribociclib)

Assessment and Plan:

Call Summary: Pt calling in to report uncontrolled nausea and dry heaving. Breast pt that took her first dose of Ribociclib yesterday. Took ondansetron at 1030 and compazine at 1130 with little relief. Only able to sip minimally on fluids. Has had a 8/10 HA this AM that pt describes as "pressure behind my eyes" and is dizzy. Does confirm light sensitivity however this is unchanged from pt's baseline. No abdominal pain, bloating, or cramping. Constipated (baseline but is on senna and miralax as she has been on opioids for pain management) with last BM yesterday. Was actively dry heaving when she was on the call. Pt was also wondering what she should do if she vomits soon after she takes her next dose of Ribociclib (She has not taken her dose for today).

Upon calling pt back for further assessment, pt stated she did vomit (approximately 1330) which improved her nausea slightly. Still reporting 8/10 HA - confirms she does have migraines occasionally without aura or NV, however she has not had one in the past week. States she takes Excedrin and another prescription she unsure of (not in medication list) for migraines but has not taken it today as she has not had a migraine recently.

Action Taken: Provider Notified

Per ONS/HOPA, pt informed to NOT take an additional dose of Ribociclib if she misses a dose/vomits her dose and instructs pt to take the routine dose the next day. Iversen PA-C responded and recommended pt to go to ED for further evaluation of HA as we are unable to see pt today. Message relayed to pt. This RN provided report to UWMC Montlake triage RN.

Response: Aware of clinic contact information, States understanding of plan, Restates plan, and No further questions

Additional documentation may exist in Flowsheets or Education Activity

CHIEF COMPLAINT

Chief Complaint

Patient presents with

- Headache
- Vomiting

HISTORY OF PRESENT ILLNESS AND REVIEW OF SYSTEMS

?
Patient is a 47 year old with a past medical history of breast cancer with bone metastases on oral chemotherapy started two days ago who presents with two days of nausea and headache since this morning.

Yesterday morning, patient had her first dose of oral chemotherapy. Later that evening, she started to feel little nauseous and fatigued. This morning, she slept until 10 AM which is highly unusual for her. When she woke up, she felt severe headache that feels similar to her chronic migraines she used to take sumatriptan for. She also felt severe nausea today that did not resolve with her normal home doses of ondansetron or Compazine. Her nausea today worsened after she took her dose of oral chemotherapy today. She messaged with her care team at Fred Hutch cancer center and was recommended to go to the emergency department given severe headache.

She has chronic photophobia and noted some ringing in her ears yesterday that has since resolved. She still has some sore throat after her chemotherapy 3 weeks ago.

She declines change in vision, nasal congestion, cough, chest pain, palpitations, shortness of breath, abdominal pain, hematuria, dysuria, urinary frequency, leg pain, leg swelling, skin change or rash. No change in gait, unilateral numbness or weakness.

Chart review:
Nurse coordination at FHCC: pt called with severe nausea after taking first dose of Ribociclib yesterday. Took ondansetron and compazine with little relief. Started having severe headache this morning with dizziness.
Was advised not to take an additional dose of Ribociclib if she misses a dose, continue to take routine doses

thereafter. Was recommended to go to the ER for further evaluation of headache by Iversen PA-C.

7/27/26 CT head and neck angio:
IMPRESSION
1. Normal head CT. No acute infarct, hemorrhage or mass effect.
2. Normal CTA head. No high-grade stenosis or occlusion.
3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.
Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.
ATTENDING COMMENT:
I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.
Fetal origin of the left PCA.
Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

[see Table 4.1]

ALLERGIES: ?
Propofol and Fentanyl

[table#4.1]:
Current Outpatient Medications

Medication Instructions

- acetaminophen (TYLENOL) 975 mg, Every 8 hours scheduled
- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- anastrozole (ARIMIDEX) 1 mg, Oral, Daily
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- lidocaine viscous 2 % mouth/throat solution 5 mL, Oral, 4 times daily PRN
- methocarbamol (ROBAXIN) 750 mg, Oral, Every 6 hours PRN
- morphine ER (MS CONTIN) 30 mg, Oral, Every 8 hours scheduled, Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER (MS CONTIN) 15 mg, Oral, Every 8 hours scheduled, Take with a 30 mg tablet for a total of 45 mg every 8 hours
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- ondansetron (ZOFRAN) 8 mg, Oral, Every 8 hours scheduled
- oxyCODONE 10-15 mg, Oral, Every 3 hours PRN

- pantoprazole (PROTONIX) 40 mg, Oral, Daily empty stomach
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily
- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily
- ribociclib (600 mg dose) (KISQALI) 600 mg, Oral, Daily, Take on days 1 to 21 followed by 7 days off. Repeat every 28 days. Do not take first dose until directed by clinical team.
- senna (SENOKOT) 17.2 mg, Oral, 2 times daily
- tretinoin 0.025 % cream 1 application, 3 times weekly

ED COURSE/MEDICAL DECISION MAKING

?
Patient is a 47 year old with a past medical history of breast cancer with bone metastases on oral chemotherapy started two days ago who presents with two days of nausea and headache since this morning.

Patient interview was notable for her headache feeling similar to her chronic migraines without any unilateral numbness or weakness. Vital signs were unremarkable. Physical exam was notable for an irregular heart rate and left CVA tenderness.

Differential includes chemotherapy side effects, chronic migraine, pyelonephritis, arrhythmia. Will order labs such as CBC, CMP, urinalysis to assess for infection or electrolyte abnormalities as well as EKG to assess for arrhythmia. Will treat pain and nausea with migraine cocktail.

ED Course as of 08/16/26 2217

Sun Aug 16, 2026

1909 Supervising resident addendum: 21M hx breast ca w mets to bone presenting with headache x1d, nausea x2 days after starting chemo. Headache similar in character to prior migraines. Will plan for labs, CT, migraine cocktail [AH]

2053 EKG NSR [AM]

2055 CBC shows anemia that is persistent with levels over the last 2 weeks [AM]

2055 Hemoglobin(!): 11.1 [AM]

2055 Hematocrit(!): 34 [AM]

2055 RBC(!): 3.72 [AM]

2153 CT head normal. Will discuss with attending about discharge [AM]

2217 Pt providing urine sample now. Order placed [AM]

Return call from Yvonne. She went to the ED yesterday after terrible nausea/vomiting at home and migraine HA. She spoke with the after hours team, who advised she present to ED. They did an EKG and CT of her head, as well as a urine sample d/t concern for UTI. She was ultimately considered safe for discharge.

We discussed that nausea could be a SE from Ribo. She is now proactively taking both Zofran and Compazine scheduled, rather than waiting until she feels nauseous. Today she feels that this has been helpful for controlling nausea. She has not vomited today. Mild HA is still present but much better. There may be a component of dehydration, so she is trying to push fluids today.

Yvonne notes feeling very fatigued on Saturday and Sunday, struggling to keep her eyes open through the day. She is trying to stay active but notes dosing off at times. She knows narcotics may be part of this. We reviewed that narcotics combined with Ribo may be causing increased fatigue and hope that this will improve with time. Briefly discussed dose reductions and Yvonne agreed to reach out to team if fatigue or other SE do not improve or become unmanageable.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7,

and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

Pain Score: 8 - Severe (8/16/2026 4:06 PM)

Safety and Mobility
Have you fallen in the past year?: No (8/20/2026 1:36 PM)

Interval history

Today, Ms. Franklin is accompanied by her husband. She reports improvement in the back and neck pain after radiation. She then had bilateral rib pain and was seen in the ACE clinic and had a CT chest done. Her systemic medication was expedited and she started a CDK 4/6 inhibitor 7 days ago. Since then the rib pain has significantly subsided.

Her main area of concern now is above the right buttocks. She says that prior to radiation, she had sharp pain which went away. But now she has stiffness and pain when bending over or walking. No numbness or weakness of her legs.

She takes morphine 45mg TID and oxycodone PRN (she has used 1 tablet every 5 hours the past 2 days, previously every 3 hours). Managed by Dr. Symonds' team.

Imaging and pathology
Reviewed in HPI

CT Head wo Contrast
Narrative: EXAMINATION:
CT HEAD W/O CONTRAST

CLINICAL INDICATION:
headache, hx breast cancer

TECHNIQUE:
5 mm MDCT images from skull base to vertex without contrast. Patient age specific parameters were used for radiation exposure.

COMPARISON:
CT head 7/27/2026

FINDINGS:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Cavernous carotids and vertebral vessels are normal.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Right maxillary sinus mucous retention cyst, otherwise the sinuses and mastoids are clear. Orbits are normal.
Impression: 1. No acute intracranial abnormality.

This is an afterhours preliminary report generated by Sina Hosseinian, PGY-3. Unless an attending attestation appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW

I agree with the preliminary report with the following comment:

Osseous lytic lesion in the left mandibular condyle with cortical breakthrough posteriorly (302/9, 10).

I have personally reviewed the images and agree with the report (or as edited).

A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Assessment
Yvonne Kalley Franklin is an 47 year old with metastatic Lt breast cancer diffusely to bone with lesions along the entire spinal axis with diffuse T-spine pain (index lesions C4, C6, T1, T4, T5, T8 with compression fractures <25%).

She has responded well to radiation with improvement in pain of her back and neck. We discussed that the source of her bilateral rib pain is still unclear but we are glad that her pain has improved while on systemic therapy.

The source of the right buttocks pain is also unclear as her prior imaging does not show one dominant lesion that we can confidently attribute as the cause that can be targeted with radiation. She has had significant improvement in her pain and has been able to reduce her need for breakthrough oxycodone very quickly after starting her systemic therapy so we are hopeful she will continue to have improved response. We are in agreement to continue monitoring and defer radiation. She knows how to contact us should her pain worsen and we can re-evaluate the role of radiation.

Plan
Return to clinic as needed.

All questions were addressed. The patient agrees with the recommended plan.

Felicia Lew, MD, DVM
Radiation Oncology Resident Physician, PGY-4

ATTENDING ATTESTATION:
I examined and evaluated the patient and agree with Dr. Lew's history, exam, and plan of care. I have made minor edits.

She will see IR Dr. Som on 8/21/26 for evaluation of spine stabilization.

Her Rt supra-buttock pain resolving prior to any initiation of therapy and now returning as a dull pain makes me suspect musculoskeletal etiology.

I spent a total of 30 minutes for the patient's care on the date of the service independent from other healthcare team members. This time encompasses review of records, personal review of imaging, face-to-face discussion with patient, placing orders/referrals, care coordination, and documentation. I provided longitudinal care for complex and serious medical problems.

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of treatment options for Vertebral Augmentation.

HISTORY OF PRESENT ILLNESS -The history is from the patient as well as from review of medical records.

Pt was recently admitted for pain control of significant metastatic disease. MRI demonstrates spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention was indicated per NSGY, and patient was discharged following adequate pain control. She has received outpatient radiation therapy three weeks ago.

Since 3 weeks ago, her pain is significantly better in her neck. However, she is having significant pain with motion in the upper spine can get to an 8 or 9. She can't bend, turn, and she is limiting her motion, as well as limiting breathing.

She also has significant pain in the hip with bending and motion 9-10 though not a direct correlate with prior imaging.

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain however has significant motion related pain up to 8-9/10 with compression fractures in her mid-upper back, likely correlating with T8. Diffuse metastases throughout the spine.

- Repeat CT T/L spine for planning, ideally
- Follow-up clinical and physical exam in a week with X-ray fiducial to confirm if only T8 area or if T3-T5 will need to be treated.

- At minimum T8 unipedicular kyphoplasty, biopsy, and ablation with general anesthesia
- She would be ok with participating in the research biobank (formal consent to be done)
- Other levels depending on physical exam.
- Hold AC as per guidelines.

Oncology Oral Treatment Education Follow-up

Yvonne Kalley Franklin is a 47 year old female receiving follow-up assessment after start of therapy. This visit was conducted in person.

Treatment Follow-Up:
Oncology Regimen: Ribociclib 600mg D1-21/28
Start Date: 8/15/26

Patient Reported Side-Effects:

Went to ED for N/V and migraine day after she started ribo, last week was taking ondansetron + compazine scheduled

Tapering off her antiemetics, no issues with N/V since ED visit

As of yesterday, stopped Zofran and now taking compazine 1x/day

Taking with food has helped

Dry mouth

FHCC resource sent to her

Harder to swallow big pills

Hydrating 40-50oz per day, recommended to have extra glass of water w/ meals

Fatigue and sedation

Massive fatigue last week, subsiding, was to the point where she couldn't keep eyes open

Dozing off on couch, taking other sedatives between morphine and oxycodone

Feels like her energy has improved this last weekend

Patient satisfied with current management? Yes

Does this regimen contain oral chemotherapy? Yes

Oral Chemo Adherence Assessment:
1. Tell me how you are taking your medication(s)?: 3 tabs daily
2. How many times have you missed doses since starting your oral chemotherapy? 0

3. What should you do if you miss a dose?: Skipped missed dose, take within 6 hrs of missed dose
4. How do you remember to take your medication(s)?: Has an app and takes with other medications
5. How much supply did you receive? 1 month
6. How do you store your medication(s)?: In the kitchen, on the counter
7. What pharmacy is your next refill coming from? CVS Specialty

Provider Notification: N/A

Follow-Up Plan:

Labs, EKG, and APP visit planned on Friday

Will add on pharm phone visit on that date

Had some questions about OTC supplements (magnesium, vitamin D and K2, etc.) - will send over labels via MCM

Patient Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, Restates plan, States understanding of follow-up information, and No further questions

Time spent with patient: 20 minutes.

FHCC PALLIATIVE CARE NOTE

VISIT INFORMATION:
Date of Service: 8/26/2026
Type of Visit: Return Visit
Referral Reason: Cancer-related pain, Symptom management (non-pain), and Emotional support/coping

ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole. Awaiting start of ribociclib. ACE visit 8/12/26 for increased pain.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/15/2026 (Planned)

End Date 11/7/2026 (Planned)

Addressed during this visit: Patient's narrative, Symptom management, Optimizing quality of life, and Education about palliative care

Participants: Patient

History of Present Illness
Yvonne Kalley Franklin is a 47 year old woman with metastatic breast cancer here today for follow up.

Cancer-related pain gradually improved after a recent morphine increase with decreased need for breakthrough oxycodone. Oxycodone 15 mg now taken about every 5 hours rather than every 3 hours, consistently for the past week; increasing pain becomes noticeable as the 5-hour mark approaches. Movement-triggered pain remains most limiting, especially transitions and core-engaging motions such as getting up or sitting down, turning or twisting in bed; pain is more tolerable when sitting still.

Early ribociclib course complicated by an ED evaluation over the weekend for headache and vomiting with inability to keep down food or water; symptoms resolved and ribociclib is now tolerated. Currently on day 12. Constipation improved with reduced oxycodone use, with daily morning bowel movements until today. Nausea improved overall; antiemetic taken last night after nausea following eggs. Appetite remains poor with little hunger; intentionally eating with focus on protein and whole foods and avoiding fried foods.

Interventional radiology visit with Dr. Sam last Friday addressed possible kyphoplasty; the team is leaning toward intervention, at least at T8. Prior radiation helped with pain control, particularly in the neck; interventional radiology is also considering whether neck disease would require a different procedure, possibly surgery.

Sleep generally adequate without difficulty falling asleep or returning to sleep; wakes around 3 AM for oxycodone and returns to sleep quickly. Turning and positioning in bed can be painful and disruptive. Fatigue was marked during the first week on ribociclib and has improved, with intermittent afternoon tiredness and occasional naps. Activity level remains high with a focus on movement, including walking about 4-6 miles per day. Mood largely positive with intermittent tearfulness and uncertainty; baseline anxiety with prior short-term anxiolytic use and no current spiraling.

Goals of Care
I discussed my role in palliative care and how our team can support her alongside oncology and interventional radiology. She shared understanding that symptom improvement is expected to be gradual and that ongoing pain can reflect both healing fractures and disease, and she voiced worry about the unknowns of whether treatment is working and whether she will be able to return to her prior baseline. I reinforced a hopeful trajectory given symptom stabilization and early improvements, while setting expectations that healing and treatment response take time.

She identified priorities of improved quality of life through better mobility, less pain, and reduced opioid needs, with the goal of resuming normal daily functioning and returning to work. She described meaningful time with her husband and children and noted that staying focused on controllable steps and appointments has helped her cope. She acknowledged a history of anxiety and discussed monitoring for worsening anxiety or spiraling, with openness to short term medication support if needed.

We explored decision making around upcoming kyphoplasty, including her weighing potential risks of a spine procedure against anticipated benefits for pain relief and mobility. I emphasized coordination with Dr Symonds and the interventional radiology team regarding timing and whether ribociclib should be held around the procedure. She also sought guidance about a work trip to New York in late September. We discussed practical burdens and symptom risks with travel, including prolonged sitting on a plane and managing luggage, especially if kyphoplasty occurs in the next few weeks. She expressed that the timing does not feel right and is leaning toward deferring travel.

I offered social work support through our team for coping strategies, communication with children, work related stressors, and potential resource needs. She expressed interest in connecting but prefers to defer scheduling until the current cluster of appointments and decisions settles, and plans to message me when ready. Code status, surrogate decision maker, and advance directives were not discussed.

Assessment & Plan

Cancer-related pain management

Pain improving with current opioids; moderate pain persists due to vertebral fractures and osseous metastases. Fracture healing contributes to ongoing pain.

- Continue Morphine ER 45 mg every 8 hours.
- Continue oxycodone 15 mg every 4 hours PRN for pain. Currently using every 5 hours.
- Coordinate with Interventional Radiology for kyphoplasty evaluation to address fracture-related pain.
- Provide anticipatory guidance on analgesic trajectory during fracture healing.
- Reassess refill interval strategy at next refill based on pain control and procedural timing.

Metastatic breast cancer to bone

Receiving ribociclib, anastrozole, Lupron, and bone-targeted infusion; recent radiation provided partial pain relief. Planning spine stabilization intervention.

- Continue ribociclib with close monitoring; obtain first on-treatment labs Friday.
- Administer Lupron and bone infusion Friday.
- Attend Interventional Radiology follow-up for imaging and procedural planning.
- Discuss medication timing around kyphoplasty with oncology and Interventional Radiology.

Opioid-induced constipation

Constipation improved with decreased oxycodone use; near-daily bowel movements.

- may continue Senna and Miralax. Current regmimen effective.
- Monitor for constipation recurrence, especially with antiemetic use or increased opioid dosing.

Nausea and decreased appetite

Nausea improved after initial ribociclib intolerance; appetite poor but intake prioritized for protein and whole foods.

- Continue antiemetics as prescribed.
- Eat small amounts frequently, prioritize protein and nutrient-dense foods.
- Emphasize hydration.
- Identify dietary triggers worsening nausea or intake tolerance.

Fatigue

Fatigue improved after initial ribociclib week; intermittent tiredness persists with high activity level.

- Allow rest and naps as needed while monitoring impact on function and quality of life.
- Continue activity and movement as tolerated.

Adjustment disorder with anxiety

Mood positive with intermittent distress and uncertainty about treatment response; baseline anxiety present but manageable.

- Monitor mood and anxiety symptoms; report worsening anxiety or impaired function.

- Consider short-term mood-stabilizing or anxiolytic medication if symptoms worsen.

Palliative care
Ongoing palliative care for symptom management, care coordination, and psychosocial support. Anticipates return to work and considering travel.

- Follow up in a couple of weeks to reassess symptoms and coordinate around kyphoplasty timing.
- Offer palliative care social work referral for counseling/CBT and practical supports.
- Consider introducing social worker in future visit to streamline communication.

Pain
Pain Source: Cancer
Opioid Prescriber: Palliative
Long Acting Opioid (strength/dose/qty): Morphine ER 45 mg TID
Short Acting Opioid (strength/dose/qty): Oxycodone 10-15 mg every 3-4 hours PRN for pain. Currently using 15 mg every 5 hours.
Adjuvant Meds: methocarbamol 750 mg every 6 hours, Tylenol 1000 mg TID
MED: 250
PMP Check (08/04/26): Yes

Opioid agreement:signed Yes

DISPOSITION:
Follow up visit in 2-3 weeks

FUNCTIONAL ASSESSMENT:
ECOG Performance Scale: (1) Restricted in physically strenuous activity, ambulatory and able to do work of light nature
Palliative Performance Scale:
Prognosis: Uncertain of prognosis

Subjective
PALLIATIVE CARE DISCUSSION:
Social History: Lives in Kirkland with husband Mark. 2 children ages 9 and 11. Corporate job. Working full time but planning to take the next month to treat pain and start treatment.
Understanding/Perspective of Illness: Metastatic disease. Treatment is palliative
Hopes, Strengths And What Brings Life Meaning Or Purpose: More time with 2 kids and family. Continuing to work and do the normal things.
Fears, Concerns, Worries: Worries about pain and controlling symptoms
Communication Preferences: Appreciates detail focused information. Uutilizes MyChart, telehealth as appropriate.

IMPORTANT CLINICAL HISTORY:
Imaging: 7/27/26 MRI C-T-L
IMPRESSION

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.
Pathology: 7/24/26 A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Treatment History: Lupron + AI. Awaiting approval for Ribociclib.

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

PHYSICAL EXAMINATION:
Not completed today as visit TH.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: No one else present

I spent a total of 45 minutes for the patient's care on the date of the service.

Current Outpatient Medications:

- acetaminophen 325 MG tablet, Take 3 tablets by mouth every 8 hours., Disp: , Rfl:
- albuterol HFA 108 (90 Base) MCG/ACT inhaler, Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing., Disp: , Rfl:
- anastrozole 1 MG tablet, Take 1 tablet by mouth daily., Disp: 30 tablet, Rfl: 11
- cholecalciferol 50 mcg (2,000 unit) capsule, Take 2 capsules by mouth daily., Disp: , Rfl:
- lidocaine viscous 2 % mouth/throat solution, Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat)., Disp: 200 mL, Rfl: 1
- methocarbamol 750 MG tablet, Take 1 tablet by mouth every 6 hours as needed for muscle spasms., Disp: 30 tablet, Rfl: 0
- morphine ER 15 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours, Disp: 42 tablet, Rfl: 0
- morphine ER 30 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours, Disp: 42 tablet, Rfl: 0
- naloxone 4 MG/0.1ML nasal spray, Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril., Disp: 2 each, Rfl: 0
- ondansetron 8 MG tablet, Take 1 tablet by mouth every 8 hours., Disp: 90 tablet, Rfl: 0
- oxyCODONE 10 MG tablet, Take 1-1.5 tablets by mouth every 3 hours as needed for moderate pain., Disp: 170 tablet, Rfl: 0
- pantoprazole 40 MG EC tablet, Take 1 tablet by mouth daily on an empty stomach., Disp: 20 tablet, Rfl: 0
- polyethylene glycol 3350 17 g packet, Take 1 packet by mouth daily. Dissolve in 4-8 ounce water., Disp: , Rfl:
- prochlorperazine 10 MG tablet, Take 1 tablet by mouth every 6 hours as needed for nausea/vomiting., Disp: 50 tablet, Rfl: 0
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:
- ribociclib (600 mg dose) 200 MG tablet therapy pack, Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days. Do not take first dose until directed by clinical team., Disp: 63 tablet, Rfl: 0
- senna 8.6 MG tablet, Take 2 tablets by mouth 2 times a day., Disp: 120 tablet, Rfl: 0
- tretinoin 0.025 % cream, Apply 1 application topically 3 times a week. Apply to face., Disp: , Rfl:

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of treatment options for vertebral augmentation.

Interval History:

She arrives for corresponding physical exam from our visit last week. Her pain is similar, with focal pain mid-back with moving, and more significant pain when attempting to bend at her low back. She reports difficulty taking deep breaths. Her overall pain is "microscopically" better than last week.

HISTORY OF PRESENT ILLNESS -The history is from the patient as well as from review of medical records.

Pt was recently admitted for pain control of significant metastatic disease. MRI demonstrates spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention was indicated per NSGY, and patient was discharged following adequate pain control. She has received outpatient radiation therapy three weeks ago.

Since 3 weeks ago, her pain is significantly better in her neck. However, she is having significant pain with motion in the upper spine can get to an 8 or 9. She can't bend, turn, and she is limiting her motion, as well as limiting breathing.

She also has significant pain in the hip with bending and motion 9-10 though not a direct correlate with prior imaging.

IMAGING STUDIES
[image][image]

CT T-L spine today 8-28-26
T8 has progressed in fracture, T9 slightly worse along the inferior endplate.

[image]

[image]

[image]
S1 has fractured in the interval

[image]
L5- approximately the same, maybe slightly worse.

Physical Exam:
Gen: NAD shivering
Lungs: Breathing well on room air
CV: WWP
Focal pain over the sacrum/coccyx region, and mid-scapula back on palpation

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain however has significant motion related pain up to 8-9/10 with compression fractures in her mid-upper back, likely correlating with T8. Diffuse metastases throughout the spine.

- X-ray fiducial to confirm if only T8 area or if T3-T5 will need to be treated. Based on exam, unlikely.
- Plan T8, S1 unipedicular kyphoplasty, biopsy, and ablation with general anesthesia. Possible T9 depending on appearance on day of procedure.
- Referral to Dr. Kang for possible radiation to sacrum/coccyx given symptoms
- She would be ok with participating in the research biobank (formal consent to be done)
- Hold AC as per guidelines.

FRED HUTCHINSON CANCER CENTER
BREAST ONCOLOGY NEW PATIENT VISIT

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?
ID/CC: 47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease, who presents today for follow up on ribociclib.

ONCOLOGY HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+

by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma
-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

8/15/26: Start Ribociclib

HPI: Please see detailed oncology history above. We spent the majority of the visit reviewing the diagnosis and discussing treatment recommendations. Please see details in the assessment and plan.

History of Present Illness
Yvonne Kalley Franklin is a 47-year-old female with metastatic hormone receptor-positive, HER2-negative breast cancer with extensive bone metastases who presents for oncology follow-up to assess treatment tolerance and symptom management.

Cancer-Related Pain and Neurologic Symptoms:

- No new or worsening pain
- No neurologic symptoms, weakness or sensory changes
- No changes in mobility or sensation
- No new breast or soft tissue lumps or open lesions

Fatigue:

- Severe fatigue during first week of CDK4/6 inhibitor therapy
- Energy has improved but remains reduced, no impact to ADLs

Chemotherapy-Induced Nausea and Vomiting:

- Significant nausea and vomiting early in treatment, including one episode requiring emergency department evaluation
- Nausea now controlled with daily Compazine and as-needed Zofran
- Limits Zofran use due to constipation
- One vomiting episode yesterday, though this remains rare for her
- Appetite remains low
- Intentionally increasing protein intake

Drug-Induced Constipation and Bowel Function:

- Severe constipation initially, attributed to opioids and Zofran
- Required aggressive bowel regimen, resulting in transient diarrhea
- Currently has regular bowel movements with daily Miralax and scheduled Senna
- No current bowel issues

Antineoplastic Therapy-Induced Neutropenia:

- Mild neutropenia with ANC of 1.1
- No fever, respiratory, or urinary symptoms

Abnormal Vaginal Bleeding and Menopausal Symptoms:

- Received first Lupron injection about one month ago

- Had a menstrual period after initial ovarian suppression, no current bleeding
- No menopausal symptoms such as hot flashes

Bone Protection Therapy (Zometa):

- No significant side effects from first Zometa infusion
- Aware of potential for flu-like symptoms after today's dose
- Plans to use Tylenol-containing medications as needed

Disease Management and Quality of Life:

- Engaged in care and prioritizes disease control and quality of life

ROS: Complete ROS was reviewed and was negative unless stated above in the HPI

ECOG: 0 (prior to diagnosis)

PMH
Medical History

Gynecology History:
Menopausal Status: premenopausal
HRT use: Denies
OCP use: Yes, from 18-33 then had IUDs (IUD recently removed)

ASSESSMENT/PLAN: 47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease, who presents today for follow up on Ribociclib
Assessment & Plan
Breast cancer metastasized to bone, unspecified laterality (HCC)
Metastatic breast cancer with extensive osseous disease. Early in CDK4/6 inhibitor, endocrine therapy, Lupron, and Zometa. Palliative intent. Tolerating with manageable AEs. Discussed treatment sequencing, QoL, and clinical trials if possible

- Continue current systemic therapy, Lupron, and Zometa.
- Lupron injection today, second dose - we discussed that we do not anticipate further episodes of vaginal bleeding and she should report it
- Zometa infusion today, second dose. Continue regular infusions. Monitor flu-like symptoms and fever.
- Plan imaging after approximately 3 months of therapy unless symptoms worsen.
- Monitor tumor markers, molecular testing, clinical symptoms, CBC, and neutrophils. Frequent CBCs initially, then decrease frequency as counts stabilize. EKG monitoring
- Nutrition referral
- Frequent follow-up for toxicity and complications.
- Reviewed expected response timeline and reportable symptoms including nausea, vomiting, constipation, fatigue, bone pain, menopausal symptoms, infection, vaginal bleeding, new pain, or neurologic symptoms.

Neoplasm-related pain
Osseous pain controlled with oxycodone and morphine. Kyphoplasty planned to hopefully improve pain and mobility, reduce opioid needs.

- Continue oxycodone and morphine.
- Proceed with ortho and spine surgery team
- Monitor pain and adjust analgesics as needed.
- Monitor for new or worsening pain or neurologic symptoms.

Antineoplastic therapy-induced neutropenia
Mild neutropenia, neutrophil count 1.1, acceptable for CDK4/6 inhibitor therapy.

- Monitor CBC and neutrophils closely during initial cycles.
- Reviewed hand hygiene and avoidance of sick contacts.
- Report upper respiratory symptoms, fever, or urinary symptoms promptly.

Chemotherapy-induced nausea and vomiting
Previously required emergency care, now controlled with scheduled Compazine and as-needed Zofran. Limits Zofran due to constipation.

- Continue scheduled Compazine PRN
- Use Zofran as needed for breakthrough nausea
- Encouraged oral intake and hydration.

Drug-induced constipation
Previously severe from opioids and antiemetics, now controlled with daily Miralax and scheduled Senna. Ongoing risk with continued therapy.

- Continue daily Miralax, 1 packet daily with minimal fluid volume.
- Continue Senna twice daily.
- Monitor bowel habits and adjust regimen as needed.

Fatigue
Severe during first week of CDK4/6 inhibitor therapy, now improved. Low energy but functional. Likely multifactorial from malignancy and therapy, with low appetite contributing.

- Monitor fatigue and energy at follow-up.
- Reassured fatigue may improve with disease control and medication adjustment.
- Provide supportive care and address contributing factors including low appetite.

Disposition: RTC 2 weeks review labs, EKG and provider visit.
Advised to contact the clinic with any questions or concerns in the interim.

To patients reading this note: Please be advised that the primary purpose of this note is for me to communicate other members of your medical team. Standard sentence structure is not always used. Medical terminology, abbreviations and acronyms may be used that are unfamiliar.

I spent a total of 30 minutes for the patient's care on the date of the service.

Oral Chemotherapy Monitoring Program

Oral chemotherapy management per FHCC CDTA

Yvonne Kalley Franklin is a 47 year old female contacted for follow up by phone for oral chemotherapy treatment monitoring.

Indication: de novo metastatic ER+/PR+, HER2-negative breast cancer
Treatment Plan/Dose: Ribociclib 600mg PO daily D1-21 q 28 days
Cycle: Subsequent Review-Refill Rx

Cycle Start Date: 08/15/26
Anticipated Next Cycle Start Date: 09/12/26

Treatment delayed or held?: No

Problem list

Patient Active Problem List

Diagnosis

- Secondary malignant neoplasm of bone (HCC)

Medications

Current Outpatient Medications

Medication Instructions

- acetaminophen (TYLENOL) 975 mg, Every 8 hours scheduled
- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- anastrozole (ARIMIDEX) 1 mg, Oral, Daily
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- lidocaine viscous 2 % mouth/throat solution 5 mL, Oral, 4 times daily PRN
- methocarbamol (ROBAXIN) 750 mg, Oral, Every 6 hours PRN
- morphine ER (MS CONTIN) 30 mg, Oral, Every 8 hours scheduled, Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER (MS CONTIN) 15 mg, Oral, Every 8 hours scheduled, Take with a 30 mg tablet for a total of 45 mg every 8 hours
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- ondansetron (ZOFRAN) 8 mg, Oral, Every 8 hours scheduled
- oxyCODONE 10-15 mg, Oral, Every 3 hours PRN
- pantoprazole (PROTONIX) 40 mg, Oral, Daily empty stomach
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily
- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily
- ribociclib (600 mg dose) (KISQALI) 600 mg, Oral, Daily, Take on days 1 to 21 followed by 7 days off. Repeat every 28 days. Do not take first dose until directed by clinical team.
- senna (SENOKOT) 17.2 mg, Oral, 2 times daily
- tretinoin 0.025 % cream 1 application, 3 times weekly

Medication History
Pt reports changes to their medication on med list: Yes
Comments: Added calcium (already on vitamin D)

Possible drug interactions:
Rx Interactions
Clinically relevant drug interactions identified?: No

Adherence Assessment:
Rx-Adherence
Was adherence assessed during this encounter?: Yes
Patient reported X missed doses in the last month: 0
Patient reported taking incorrect dose in the last month: No
Concerns for Adherence?: No

Symptom/Toxicities Assessment:
Patient reports the following side effects:
Side effects to report?: Yes

General: Fatigue: Grade 1 (Mild, able to do ADLs);

Gastrointestinal: Nausea: Grade 1 (Will switch from compazine BID to ondansetron BID as it works better - will monitor for constipation);

Interventions and Follow-up Plan:

Plan: 8/28 labs reviewed and QTcF 451ms today - OK to proceed with current cycle of ribociclib. She plans on switching from compazine BID to ondansetron BID as is more effective, but she is wary about constipation. CTM. If needing scheduled ondansetron in the future, consider additional EKG given mild QTcF elevation.

A prescription for ribociclib will be sent to CVS Specialty pharmacy. Future refills will be managed by the FHCC Oral Chemotherapy Service.

Follow-up Dates:
Date of next outreach:: 09/11/26
Next Outreach type:: Phone
Date of next pharmacist lab review:: 09/11/26
Next refill due: 11/20/26
Reference: MONALEESA-2

ATTENDING: Purcell, William Thomas, MD
Symonds, Lynn Katherine, MD

DIAGNOSIS AND IDENTIFICATION:
47-year-old premenopausal woman with de novo metastatic ER+/PR+, HER2-negative breast cancer with predominantly osseous metastatic disease

CURRENT THERAPY:
Lupron, Anastrozole, Ribociclib, Zometa

Last treatment date:
Ribociclib: will finish current cycle tomorrow
Lupron: 8/28
Zometa: 8/28

SITUATION/BACKGROUND:
Call to discuss symptoms reported in MCM

ASSESSMENT:
Patient Reports:

Lower back pain

She's able to walk, but often as she takes a step, she gets sharp pain in her lower back. Notices this with both legs, but maybe slightly more on the right.

Painful area is roughly 5 inches above tailbone in the middle, about where top of mid-rise jeans would fit.

Also notices when sitting or lying down

Difficult to get up from laying down due to pain.

Pain with walking up the stairs, more so when stepping with R foot.

Pain meds are not really changing the pain level

She denies other areas of increased pain, changes to bowel or bladder, and numbness/tingling in her legs.

Yvonne is otherwise feeling well and notes pain improvement elsewhere, specifically in her upper back. Radiation was very successful in her upper back and she's open to discussion about her lower back.

Yvonne has 1 more day of Ribo and then will start the off week. We discussed refill process and timing to call specialty pharmacy. RN to follow up with pharmacists regarding next script, which is ordered as "future" for 9/12.

Patient Denies:

- changes in balance, constipation, dehydration, diarrhea, muscle or joint pain, numbness or tingling, and urination changes. Denies new pain in other parts of her body.

Home Care Tried (if any):
Yvonne had previously decreased Oxy dose due to feeling better overall, but has increased again for back pain

management, though she does not feel that it's effective.

PLAN & RECOMMENDATIONS:
Relayed that Dr. Symonds reached out to Dr. Kang about potential radiation to this area. Yvonne is open to this.
RN will send note details to Drs Symonds and Kang as well.
RN follow up with pharmacists about Ribo prescription.

Return/ED Precautions:
Call back if: fever (100.4 F or above), new or worsening symptoms, shortness of breath, dizziness, and any other questions or concerns

Reviewed Spinal Cord Compression symptoms with Yvonne and she understands to go directly to ER if she develops any of these symptoms

Action Taken: Provider Notified

Patient Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, and No further questions

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of treatment options for vertebral augmentation.

INTERVAL HISTORY
Her husband had a series of questions and had brought up conservative management of T8. She would like to plan for S1 for sure and the pain at T8 has improved somewhat but still difficulty in breathing and some discomfort with motion.

HISTORY OF PRESENT ILLNESS -

Pt was recently admitted for pain control of significant metastatic disease. MRI demonstrates spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention was indicated per NSGY, and patient was discharged following adequate pain control. She has received outpatient radiation therapy three weeks ago. Since 3 weeks ago, her pain is significantly better in her neck.Last week she reported significant pain with motion in the upper spine can get to an 8 or 9. She can't bend, turn, and she is limiting her motion, as well as limiting breathing. However messages sent from her husband on her account noted significant improvement and the desire to be conservative at T8. Discussion on conference call today noted T8 bothers her but is getting better. She still has significant pain in the hip with bending and motion 9-10 though not a direct correlate with prior imaging.

IMAGING STUDIES
[image][image]

CT T-L spine today 8-28-26
T8 has progressed in fracture, T9 slightly worse along the inferior endplate.

[image]

[image]

[image]
S1 has fractured in the interval

[image]
L5- approximately the same, maybe slightly worse.

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain however has significant motion related pain at S1 and some continued discomfort at T8 with shortness of breath and pain.

- Plan S1 unipedicular kyphoplasty, biopsy, and ablation with general anesthesia. If still having pain at T8 can consider T8 kyphoplasty.
- Referral to Dr. Kang for possible radiation to sacrum/coccyx given symptoms
- She would be ok with participating in the research biobank (formal consent to be done)
- Hold AC as per guidelines.

Avik Som, MD, PhD
UW Interventional Radiology

I spent 30 minutes on exam and care with the patient.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, audio only conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

FRED HUTCH PALLIATIVE CARE NURSE NOTE

VISIT INFORMATION:
Date of Service: 9/8/2026

ID/CC: Refill Request

Participants: Patient

Problem: Controlled Request
Impression: RN call to check on pain/ complete RX refill. Yvonne feels like her back "is a mystery." Lower back pain has stabilized and not that bad anymore. Says it's been a big swing with how pain feels. Overall has been a huge improvement. Lower back still feels "tight" d/t fracture & will have kyphoplasty completed, but no longer feels sharp. Met with IR last Friday for evaluation/ kyphoplasty planning. Pain at R rib has been there on & off, but has been more painful this week. PRN oxycodone helps, but says rib pain "is what it is" and feels manageable. She feels the best she has felt since being diagnosed this week. PRN oxycodone use has decreased to TID dosing (takes 10-15mg per dose depending on pain level). She is not waking up to take oxycodone overnight anymore

Abbreviated Pain Assessment:
1. Are there any changes to pain since you were last seen? Other: yes, see above
2. Are you satisfied with your current pain regimen? Yes
3. How are you taking the pain medication (morphineER)? 45mg q8hrs
4. Have you noticed any new side effects? None

Pain Source: Cancer
Opioid Prescriber: Palliative care
Long Acting Opioid (strength/dose/qty): morphineER 45mg q8hrs
Short Acting Opioid (strength/dose/qty): oxycodone 15mg q4hrs PRN
Adjuvant Meds: tylenol
Total MEDD: 180 - 202.5mg
Pill Counts: morphineER: # 4 - 5 tabs
morphineER: # 4-5 tabs

Date of last appointment: 8/26/2026
Date of next appointment: 9/23/2026

FRED HUTCHINSON CANCER CENTER
BREAST ONCOLOGY RETURN VISIT

ID/CC: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) currently on OS+AI+ribociclib here for follow-up

ONCOLOGY HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma
-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

-8/15/26: Start Ribociclib

Interval History:
-Her pain is significantly better, she has been able to use less pain medication
-Walking 4-6 miles a day now and doing light weight lifting
-Her body did adjust to the medication, but beginning was a rough start
-She is experiencing nausea, but feels much better during the off the week
-Fatigue is present
-Still losing weight

ROS: Complete ROS was reviewed and was negative unless stated above in the HPI

ECOG: 0 (prior to diagnosis)

MEDICATIONS

Outpatient Medications Prior to Visit

Medication Sig Dispense Refill

- acetaminophen 325 MG tablet Take 3 tablets by mouth every 8 hours.
- albuterol HFA 108 (90 Base) MCG/ACT inhaler Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing.
- anastrozole 1 MG tablet Take 1 tablet by mouth daily. 30 tablet 11
- cholecalciferol 50 mcg (2,000 unit) capsule Take 2 capsules by mouth daily.
- lidocaine viscous 2 % mouth/throat solution Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat). (Patient not taking: Reported on 8/28/2026) 200 mL 1
- morphine ER 15 MG ER tablet Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours 90 tablet 0
- morphine ER 30 MG ER tablet Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours 90 tablet 0
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril. 2 each 0
- oxyCODONE 10 MG tablet Take 1-1.5 tablets by mouth every 3 hours as needed for moderate pain. 170 tablet 0
- pantoprazole 40 MG EC tablet Take 1 tablet by mouth daily on an empty stomach. (Patient not taking: Reported on 8/28/2026) 20 tablet 0
- polyethylene glycol 3350 17 g packet Take 1 packet by mouth daily. Dissolve in 4-8 ounce water.
- prochlorperazine 10 MG tablet Take 1 tablet by mouth every 6 hours as needed for nausea/vomiting. 50 tablet 0
- propranolol 10 MG tablet Take 1 tablet by mouth daily.
- [START ON 9/12/2026] ribociclib (600 mg dose) 200 MG tablet therapy pack Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days. 63 tablet 2
- tretinoin 0.025 % cream Apply 1 application topically 3 times a week. Apply to face.

No facility-administered medications prior to visit.

ASSESSMENT/PLAN: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) currently on OS+AI+ribociclib here for follow-up

#Breast Cancer: Patient presented with several months of back pain. An MRI on 7/1/26 showed expansile lesions in T1, T5, T8-T10. Subsequent CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules. PET CT on 7/21/26 showed FDG avid lesions in L breast, R axilla, and bones. Left breast core biopsy on 7/22/26 showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30%. Right axillaary LN biopsy showed metastatic carcinoma. Right iliac crest biopsy also showed metastatic carcinoma. She subsequently admitted for pain control and started on lupron+anastrozole. She has now started ribociclib and pain is slowly improving. Overall tolerating well with nausea and fatigue. We will plan to continue at current dose. CEA is declining today which paired with improvement in her pain is reassuring that she is clinically responding. She is scheduled with IR for kyphoplasty as below.
-Continue lupron q4 weeks
-Continue anastrozole daily
-Continue ribociclib (no changes to dose today)
-Repeat PET CT due November 2026
-Scheduled to meet with nutrition
-Will send next generation sequencing on tumor sample (pending)

#pain management: s/p palliative RT to right hip joint. Following with palliative care for pain management. She is following with IR/rad-onc and team is planning for S1 unipedicular kyphoplasty, biopsy, and ablation with general anesthesia and team may consider T8 kyphoplasty if still having pain in that area.

#Bone Mets:
-Continue zometa q4 weeks
-Continue calcium and vitamin D

#Genetics: Genetic testing recommended in the setting of metastatic breast cancer

Return: 1 month

Oral Chemotherapy Monitoring Program

Oral chemotherapy management per FHCC CDTA

Yvonne Kalley Franklin is a 47 year old female contacted for follow up by phone for oral chemotherapy treatment monitoring.

Indication: de novo metastatic ER+/PR+, HER2-negative breast cancer
Treatment Plan/Dose: Ribociclib 600mg PO daily D1-21 q 28 days
Cycle: Subsequent Review-Refill Rx

Cycle Start Date: 09/12/26
Anticipated Next Cycle Start Date: 10/10/26

Treatment delayed or held?: No

Problem list

Patient Active Problem List

Diagnosis

- Secondary malignant neoplasm of bone (HCC)

Medications

Current Outpatient Medications

Medication Instructions

- acetaminophen (TYLENOL) 975 mg, Every 8 hours scheduled
- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- anastrozole (ARIMIDEX) 1 mg, Oral, Daily
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- lidocaine viscous 2 % mouth/throat solution 5 mL, Oral, 4 times daily PRN
- morphine ER (MS CONTIN) 30 mg, Oral, Every 8 hours scheduled, Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER (MS CONTIN) 15 mg, Oral, Every 8 hours scheduled, Take with a 30 mg tablet for a total of 45 mg every 8 hours
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- oxyCODONE 10-15 mg, Oral, Every 3 hours PRN
- pantoprazole (PROTONIX) 40 mg, Oral, Daily empty stomach
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily

- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily
- [START ON 9/12/2026] ribociclib (600 mg dose) (KISQALI) 600 mg, Oral, Daily, Take on days 1 to 21 followed by 7 days off. Repeat every 28 days.
- tretinoin 0.025 % cream 1 application, 3 times weekly

Medication History
Pt reports changes to their medication on med list: No

Possible drug interactions:
Rx Interactions
Clinically relevant drug interactions identified?: No

Adherence Assessment:
Rx-Adherence
Was adherence assessed during this encounter?: Yes
Patient reported X missed doses in the last month: 0
Patient reported taking incorrect dose in the last month: No
Concerns for Adherence?: No

Symptom/Toxicities Assessment:
Patient reports the following side effects:
Side effects to report?: Yes

General: Fatigue: Grade 1;

Gastrointestinal: Nausea: Grade 1 (Going to take Zofran 30 min before Kisqali dose. Taking Kisqali w/ meals - seen inprovement in nausea since doing this);

Interventions and Follow-up Plan:

Plan: 9/11 labs reviewed - ok to continue ribociclib, pt will start new cycle tomorrow. Will try to take Zofran 30 min before Kisqali doses to alleviate some nausea, she'll try to peel of nausea meds and use on more prn basis if she thinks nausea is well controlled. Has compazine on hand as well. Will f/u with labs in 2 weeks.

A prescription for ribociclib will NOT be sent to CVS Specialty pharmacy. Future refills will be managed by the FHCC Oral Chemotherapy Service.

Follow-up Dates:
Date of next outreach:: 09/25/26

Date of next pharmacist lab review:: 09/25/26
Next refill due: 11/20/26
Reference: MONALEESA-2

FRED HUTCHINSON CANCER CENTER
Genetic Counseling Clinic Note
Date of Visit: 9/14/2026

PATIENT IDENTIFICATION
Legal Name: Yvonne Kalley Franklin
Name in use: Yvonne
DOB: 6/17/1979
MRN: U4772842
Pronouns: she/her/hers

REASON FOR VISIT
Yvonne Kalley Franklin was referred for a genetic evaluation regarding her recent diagnosis of breast cancer.

Referred by: Lynn Symonds, MD
825 Eastlake Avenue East
Seattle, WA 98109-4405

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: Off-site location (home, non-UW location)
Patient Location: At home
Present with patient: No one else present

I spent a total of 35 minutes of face-to-face time with Yvonne.

MEDICAL AND FAMILY HISTORY
Refer to the below pedigree obtained at this clinic visit based on information provided by Yvonne.

[image]

Yvonne is a 47 year old female. Yvonne Kalley Franklin was recently diagnosed with de novo metastatic ER+/PR+, HER2-negative ILC of left breast with predominantly osseous metastatic disease. Received palliative radiation and been on Ribociclib.

Cancer screenings and significant history detailed below:

COLON: C-scope in 2021 with 1 tubular adenoma. C-scope in 2023.

GYN: Retains ovaries and uterus.
Age of Menarche:16
Menopausal Status:perimenopausal
G2P2
Age of First Birth:35
HRT Last Use:N/A

SKIN: No prior concerns.

She has no prior germline cancer-related genetic testing.

The family history is listed below:

Children: 1 son, 1 daughter (ages 9 and 11)

Siblings: 1 maternal half-brother

Maternal Family: Grandmother had colon cancer and passed at 52.

Paternal Family: No information and no contact.

Ethnicity: Maternal ancestry is Central/Eastern European; paternal ancestry is Central/Eastern European. Yvonne reports no Ashkenazi Jewish ancestry.

GENETIC COUNSELING
Cancer occurs due to a combination of environmental and genetic factors. Most cancers are sporadic, or occur at random, without a strong hereditary component. About 5-10% of cancers are thought to be caused by cancer predisposition syndromes, which are associated with a mutation in a single gene that increases a person's risk for certain cancers. When a hereditary cancer predisposition syndrome is present in a family, there is a list of common patterns that can be seen. These patterns include: multiple family members and/or multiple generations affected with cancer, cancers diagnosed at younger ages than expected, individuals with multiple primary cancers, or rare types of cancer pathologies.

Yvonne's recent diagnosis of early-onset breast cancer raises suspicion for a genetic cancer susceptibility. The most common genes associated with hereditary breast cancer are BRCA1 and BRCA2. Mutations in these genes have been shown to increase the lifetime risk for breast and ovarian cancer, increase risk for male breast cancer, prostate cancer, and in some families increase the incidence of pancreatic cancer and melanoma. Other possible hereditary risks for breast cancer include mutations in genes such as ATM, CDH1, CHEK2, PALB2, PTEN, and TP53.

Yvonne meets NCCN criteria for cancer-related genetic testing.

We discussed the implications of genetic testing for Yvonne and her family members. Identifying a pathogenic variant can broaden treatment options, guide screening and management, and identify cancer risks not indicated by family history. We discussed various options for pursuing genetic testing, along with potential results (i.e., positive, negative and a variant of uncertain significance) and inheritance pattern.

Yvonne decided to proceed with cancer-related genetic testing. She was motivated by a desire to inform possible treatments and hereditary cancer risks for self and children.

PLAN
1. Verbal informed consent was obtained, and the patient will have blood drawn on 9/25/26 at the FHCC Alliance Lab. This will be sent to Invitae for testing.
2. Invitae will facilitate billing with Yvonne's insurance.
3. The results will be disclosed by phone in 2-3 weeks.
4. Further plans for cancer screening and risk reduction can be made pending the outcome of this testing.

I gave Yvonne my contact information for any additional questions or concerns.

Narrative & Impression

NORMAL SINUS RHYTHM
POSSIBLE LEFT ATRIAL ENLARGEMENT
LOW VOLTAGE QRS IN PRECORDIAL LEADS
NONSPECIFIC T WAVE ABNORMALITY
PROLONGED QT
ABNORMAL ECG
WHEN COMPARED WITH ECG OF 28-Aug-2026 14:28,
NO SIGNIFICANT CHANGE WAS FOUND

Echo 12/9/19
INTERPRETATION SUMMARY
Normal left ventricle chamber size and function with an EF of 55-60%

Normal right ventricle chamber size and function.
Normal left and right atria.
No hemodynamically significant valvular abnormalities seen.
Normal estimated RVSP of <20mmHg.
Normal IVC size with normal respiratory collapse.

Intertrial septal aneurysm is noted with no doppler evidence of a shunt.

Perioperative Risk Scores:

DUKE

Total Score: 18 | V02Peak: 17.34 | METS: 4.95

Obstructive Sleep Apnea (OSA): Low Risk Total Score: 2

Score Rules

[image:Abnormal] Patient snores loudly

[image:Abnormal] Patient is often tired

Criteria that do not apply:

Patient has been observed to stop breathing during sleep

Patient has high blood pressure or is being treated for high blood pressure

Patient BMI is greater than 35 kg/m2

Patient is over 50 years old

Patient's neck circumference is greater than 17 inches (male) or 16 inches (female)

Patient is male

NON-OR PREPROCEDURE H&P

Planned procedure: NIR ANGIO VERTEBROPLASTY [AVERPL]
Diagnosis and indications for procedure: Pathologic fracture

Non-OR Pre-Procedure H&P: I have recorded the Relevant History and Changes to History below AND I have reviewed any available pre-procedure screening/assessments on the EMR or written forms.

RELEVANT HISTORY OR CHANGE TO HISTORY:

Medical History
Surgical History
Social History

Medications:
I have reviewed any medications recorded on any pre-procedure assessment or the EMR.

Current Outpatient Medications

Medication Instructions

- acetaminophen (TYLENOL) 975 mg, Every 8 hours scheduled
- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- anastrozole (ARIMIDEX) 1 mg, Oral, Daily
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- lidocaine viscous 2 % mouth/throat solution 5 mL, Oral, 4 times daily PRN
- morphine ER (MS CONTIN) 30 mg, Oral, Every 8 hours scheduled, Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER (MS CONTIN) 15 mg, Oral, Every 8 hours scheduled, Take with a 30 mg tablet for a total of 45 mg every 8 hours
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- ondansetron (ZOFRAN) 8 mg, Every 8 hours
- oxyCODONE 10-15 mg, Oral, Every 3 hours PRN
- pantoprazole (PROTONIX) 40 mg, Oral, Daily empty stomach
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily
- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily
- ribociclib (600 mg dose) (KISQALI) 600 mg, Oral, Daily, Take on days 1 to 21 followed by 7 days off. Repeat every 28 days.
- tretinoin 0.025 % cream 1 application, 3 times weekly

Allergies:
I have reviewed any allergies recorded on any pre-procedure assessment or the EMR.
Review of patient's allergies indicates:

Airway Placement

Staff:
Performing Provider: Sy, Diane Elizabeth, CRNA
Authorizing Provider: Banyas, Michael R, MD

Airway management:
Patient location: OR/Procedural area
Final airway type: Endotracheal airway
Intubation reason: General anesthesia/planned procedure

Induction:
Positioning: supine
Preoxygenation: Yes
Mask Ventilation:Grade 1 - Ventilated by mask

Intubation:

Number of Attempts: 1

Final Attempt
Airway Type: ETT
Primary Laryngoscopy: GlideScope
Glidescope Blade Geometry: LoPro (hyperangulated)
Blade Size: 3
Laryngoscopic View: Grade I
ETT Type: standard, cuffed
ETT Route:oral

Size: 7
ETT secured with adhesive tape and ETT holder
Depth at:teeth (21cm)
Bite Block: handmade cotton & tape - unilateral

Assessment:
Confirmation: waveform capnography, auscultation and direct visualization
Difficult Airway: no
Procedure Abandoned: no

Date / Time Airway Secured / Re-Secured:
9/16/2026 2:13 PM

Final procedure comments:
Elective use of Glidescope Lo Pro 3 d/t hx of C spine stenosis and limited mobility. Pt pre-oxygenated for > 2 mins, verified that neck is in comfortable position prior to starting induction. Smooth, standard induction, easy mask. With Cspine in neutral position, glidescope introduced. Easy, grade 1 view, oropharyngeal structures undamaged and unchanged from pre-op. Soft gauze roll bite block in place.

FHCC PALLIATIVE CARE NOTE

VISIT INFORMATION:
Date of Service: 9/23/2026
Type of Visit: Return Visit
Referral Reason: Cancer-related pain, Symptom management (non-pain), and Emotional support/coping

ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole. Awaiting start of ribociclib. ACE visit 8/12/26 for increased pain. Kyphoplasty 9/16/26.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/15/2026

End Date 11/7/2026 (Planned)

Addressed during this visit: Patient's narrative, Symptom management, Optimizing quality of life, and Education about palliative care
Participants: Patient

History of Present Illness
Yvonne Kalley Franklin is a 47 year old woman with de novo metastatic breast cancer here today for follow up.

Over the last month, overall symptoms have improved with better energy. She is in week 2 of cycle 2 of ribociclib, better tolerated than cycle 1. She stopped anti-nausea medication 3 days ago without recurrent nausea. Tumor markers are down per recent discussion with Dr. Symonds.

One week status post vertebral cementing or kyphoplasty with expected post-procedure soreness at cemented sites, worst in the mid-back, steadily improving and now about 80% healed. Residual discomfort is mild soreness most noticeable with movement or engaging that area. A low back ache is also present; lumbar MRI is scheduled tomorrow to further consider radiation and possible new progression with new pain.

Analgesic regimen has been stable for the last couple of weeks with morphine ER 45 mg three times daily and oxycodone IR 10 mg three times daily, taken together around 7 am, 3 pm, and 10 pm. Pain is most noticeable in the evening before bed, particularly after light weightlifting. Overnight sleep is not interrupted by pain; she wakes only to urinate and returns to sleep without analgesics. Mornings are marked by generalized stiffness and aches rather than focal pain. The mid-day dose is sometimes taken without clear pre-dose pain escalation. She wants to cautiously reduce opioids.

Constipation is well controlled on senna plus polyethylene glycol after earlier constipation. She is no longer taking a muscle relaxant previously used for spasms. No hot flashes. No current vaginal pain or discomfort.

Goals of Care

I acknowledged recent improvements with kyphoplasty recovery, better tolerance of Kisqali, and downtrending tumor markers per her discussion with Dr. Symonds, while also naming the uncertainty early in treatment. She shared ongoing fear and worry about what comes next and noted that any new ache increases her anxiety, with MRI planned to assess for possible progression and consideration of additional radiation.

She emphasized priorities of regaining strength and function and staying present day to day. She described focusing on nutrition, increasing protein, and gradually returning to activity including light progressive weightlifting and cardiovascular exercise, with her husband providing close support and guidance for safe incremental progress. She stated a goal to reduce medications when possible without sacrificing comfort or function.

I discussed a stepwise approach to opioid de-escalation to avoid pain crisis and withdrawal symptoms. She stated she is not willing to tolerate pain that interferes with function and preferred a trial of using oxycodone immediate release only as needed while continuing morphine extended release for now, with close monitoring over the next week to guide further reductions. No discussion of code status, advance directives, or surrogate decision maker occurred.

Assessment & Plan

Cancer-related pain

Pain improved with increased activity; mild postoperative soreness at kyphoplasty sites, no need for nocturnal analgesics.

- Change oxycodone immediate release to 10 mg orally every 4 hours as needed; maintain morphine extended release at the current dose during a 1-week trial to quantify PRN needs.
- Take oxycodone as needed when pain increases, prior to pain becoming function-limiting.
- Reassess morphine extended release needs after the 1-week trial before making a dose reduction.
- Refill oxycodone immediate release prescription.
- Follow up with Glenn, palliative care pharmacist, in 1 week to review PRN opioid use and plan stepwise taper.
- Discuss stepwise opioid reductions as tolerated; next morphine extended release reduction to 30 mg, frequency to be determined based on PRN needs.
- Follow up with palliative care in 3-4 weeks.

Opioid-induced constipation

Constipation well-controlled on current bowel regimen.

- Refill senna.
- Continue senna and polyethylene glycol (Miralax) regimen.

Metastatic breast cancer to bone

Improved tolerance to ribociclib; tumor markers decreased; ongoing post-kyphoplasty recovery; new lumbar symptoms under evaluation.

- Proceed with lumbar spine MRI to assess for progression and guide possible radiation to lower back.
- Continue ribociclib and letrozole per oncology.
- Hold antiemetics as currently not needed.

Palliative care

Focus on symptom management, opioid tapering, functional optimization, and anticipatory guidance regarding hormone suppression-related symptoms and sexual health.

- Refer to Kelly Nelson (Sexual Health Clinic) for counseling and management of hormone suppression-related symptoms; schedule for future date.
- Ensure referral to Jennifer (social worker) is in place.
- Trial hyaluronic acid vaginal suppositories if vaginal dryness develops.
- Consider topical vaginal estrogen for significant symptoms; discuss with oncology if needed.

Pain
Pain Source: Cancer
Opioid Prescriber: Palliative
Long Acting Opioid (strength/dose/qty): Morphine ER 45 mg TID
Short Acting Opioid (strength/dose/qty): Oxycodone 10-15 mg every 3-4 hours PRN for pain. Currently using 10 mg TID
Adjuvant Meds: Tylenol 1000 mg TID
MED: 180
PMP Check (08/04/26): Yes

Opioid agreement:signed Yes

DISPOSITION:
Follow up visit in 2-3 weeks

FUNCTIONAL ASSESSMENT:
ECOG Performance Scale: (1) Restricted in physically strenuous activity, ambulatory and able to do work of light nature
Palliative Performance Scale:
Prognosis: Uncertain of prognosis

Subjective
PALLIATIVE CARE DISCUSSION:
Social History: Lives in Kirkland with husband Mark. 2 children ages 9 and 11. Corporate job. Working full time but planning to take the next month to treat pain and start treatment.
Understanding/Perspective of Illness: Metastatic disease. Treatment is palliative
Hopes, Strengths And What Brings Life Meaning Or Purpose: More time with 2 kids and family. Continuing to work and do the normal things.
Fears, Concerns, Worries: Worries about pain and controlling symptoms
Communication Preferences: Appreciates detail focused information. Uutilizes MyChart, telehealth as appropriate.
Role Of Spirituality, Faith, Religion, Spiritual Assessment:

Past Experience With Serious Illness/Hospice:
Acceptable Quality Of Life:

Symonds, Lynn Katherine, MD as Oncologist (Hematology-Oncology)

Brustkern, Amy K, PA-C as Physician Assistant (Palliative Medicine)

IMPORTANT CLINICAL HISTORY:
Imaging: 7/27/26 MRI C-T-L
IMPRESSION

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.
Pathology: 7/24/26 A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Treatment History: Lupron + AI. Awaiting approval for Ribociclib.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the

abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0. Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

7/29/26 Palliative radiation to C4-T11 800cGy in Fx

8/14/26 Start Ribociclib 600mg, 3 wks on, 1 wk off

Secondary malignant neoplasm of bone (HCC)

PHYSICAL EXAMINATION:
Not completed today as visit TH.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks

and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: No one else present

I spent a total of 43 minutes for the patient's care on the date of the service.

Current Outpatient Medications:

- acetaminophen 325 MG tablet, Take 3 tablets by mouth every 8 hours., Disp: , Rfl:
- albuterol HFA 108 (90 Base) MCG/ACT inhaler, Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing., Disp: , Rfl:
- anastrozole 1 MG tablet, Take 1 tablet by mouth daily., Disp: 30 tablet, Rfl: 11
- cholecalciferol 50 mcg (2,000 unit) capsule, Take 2 capsules by mouth daily., Disp: , Rfl:
- lidocaine viscous 2 % mouth/throat solution, Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat). (Patient not taking: Reported on 8/28/2026), Disp: 200 mL, Rfl: 1
- morphine ER 15 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- morphine ER 30 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- naloxone 4 MG/0.1ML nasal spray, Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril., Disp: 2 each, Rfl: 0
- ondansetron 8 MG tablet, Take 1 tablet by mouth every 8 hours., Disp: , Rfl:
- oxyCODONE 10 MG tablet, Take 1-1.5 tablets by mouth every 3 hours as needed for moderate pain., Disp: 170 tablet, Rfl: 0
- pantoprazole 40 MG EC tablet, Take 1 tablet by mouth daily on an empty stomach. (Patient not taking: Reported on 8/28/2026), Disp: 20 tablet, Rfl: 0
- polyethylene glycol 3350 17 g packet, Take 1 packet by mouth daily. Dissolve in 4-8 ounce water., Disp: , Rfl:
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:
- ribociclib (600 mg dose) 200 MG tablet therapy pack, Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days., Disp: 63 tablet, Rfl: 2
- tretinoin 0.025 % cream, Apply 1 application topically 3 times a week. Apply to face., Disp: , Rfl:

Dietary Supplements: Reviewed, pt reports taking vitamin D, iron, magnesium glycinate, zinc and omega 3

Current Outpatient Medications

Medication Instructions

- acetaminophen (TYLENOL) 975 mg, Every 8 hours scheduled
- albuterol HFA 108 (90 Base) MCG/ACT inhaler 2 puffs, Every 4 hours PRN
- anastrozole (ARIMIDEX) 1 mg, Oral, Daily
- cholecalciferol (VITAMIN D-3) 4,000 units, Daily
- lidocaine viscous 2 % mouth/throat solution 5 mL, Oral, 4 times daily PRN
- morphine ER (MS CONTIN) 30 mg, Oral, Every 8 hours scheduled, Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER (MS CONTIN) 15 mg, Oral, Every 8 hours scheduled, Take with a 30 mg tablet for a total of 45 mg every 8 hours
- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- ondansetron (ZOFRAN) 8 mg, Every 8 hours
- oxyCODONE 10 mg, Oral, Every 3 hours PRN
- pantoprazole (PROTONIX) 40 mg, Oral, Daily empty stomach
- polyethylene glycol 3350 (MIRALAX) 17 g, Daily
- propranolol (INDERAL) 10 mg, Daily
- ribociclib (600 mg dose) (KISQALI) 600 mg, Oral, Daily, Take on days 1 to 21 followed by 7 days off. Repeat every 28 days.
- senna (SENOKOT) 17.2 mg, Oral, Nightly PRN
- tretinoin 0.025 % cream 1 application, 3 times weekly

Intake: since diagnosis Yvonne has been working on increasing protein intake.
24 Hour Recall:
Breakfast: overnight oats with protein powder and fruit
Lunch: ground beef, rice, cauliflower, broccoli and Brussels sprouts
Snack: fruit, Fairlife protein shake (30 gm)
Dinner: salad (tomatoes, cucumber, butter lettuce), turkey meatball
Beverages: water, coffee, green tea

Nutrition Impact Symptoms: none; C1 of Ribociclib experienced low appetite, nausea and vomiting, these have not returned with C2

Physical Activity: daily 4-6 mile walk, weight lifting 4x/week

Anthropometrics:
Weight History: Weight: Patient reported usual body weight: 125 pounds and pt notes loss associated with poor intake at diagnosis and side effects from C1

Wt Readings from Last 4 Encounters:

09/11/26 54 kg (119 lb)

08/28/26 56.2 kg (124 lb)

DIAGNOSIS
Behavioral/Environmental:
-- Opportunity for nutrition education related to lack of prior education by RD on the topic of nutrition and breast cancer, as evidenced by patient with questions about the topic, Status: New

INTERVENTION

Nutrition Prescription:
Estimated Macronutrient Needs
Based on actual weight (54 kg)
1400-1500 kcal (MSJ 1156 x 1.2-1.3)
65-80 g protein (1.2-1.5 g/kg)

1900 ml fluid (35 ml/kg)

Recommended Diet: General

Nutrition Education and Counseling:
-- Nutrition Prescription Education: Reviewed AICR/ACS recommendations on diet and lifestyle for cancer prevention and survivorship, Reviewed lack of cancer-related evidence-based guidelines to support avoiding sugar/carbohydrates and avoiding soy/phytoestrogens

Person(s) Instructed: Patient
Desire and Motivation to Learn: Patient/caregiver demonstrated understanding of information provided, Engaging with education, asking questions, Reports ready to learn/make changes
Special Learning Needs: None
Teaching Methods Utilized: Explanation, Printed material
Handouts Provided: AICR Guidelines 9/23/26, Phytoestrogen-Containing Foods and Supplements 9/23/26

MONITORING AND EVALUATION

Nutrient Intake: % energy needs met, % protein needs met, % fluid needs met, adherence to AICR guidelines
Weight: Goals for weight: Maintenance
Nutrition Impact Symptoms: anorexia, emesis, nausea
Physical Activity: maintenance of current habits

Patient Acuity: Low nutrition acuity

MNT Service Group: Breast

Follow up: PRN, Provided RD contact information

Radiation Oncology Consent Note

This visit was to sign consent. Please see prior note for HPI and plan.

Yvonne Kalley Franklin is a 47 year old female with metastatic Lt breast cancer (ER+/PR+/Her2-) diffusely to bone with lesions along the entire spinal axis with diffuse T-spine pain (index lesions C4, C6, T1, T4, T5, T8 with compression fractures <25%) s/p 8 Gy x1 to C4-T11 on lupron, anastrozole, ribociclib since Jul-Aug '26

Yvonne was accompanied by her husband. She reports no pain even with movement. She had mild discomfort along her left buttocks after the kyphoplasty that is improving.

There were no vitals taken for this visit.

-CT-simulation
-Plan to start radiation 10/1

Radiation Treatment Plan:
Consenttoday
SIMtoday
RN Teachtoday

Skin Care:
Addressed not to put anything 2 hours before each radiation treatment. Written information provided.
Hydrogel or Aquaphor given: No

Radiation Treatment Site: Sacrum

of Fractions: 5

Patient Questionnaire: completed
Social worker referral: Not needed at this time
Nutrition referral: Not needed at this time

Pt does not have a pacemaker.

Pt had recently received radiation treatment to her spine.
I met the patient for the teach, accompanied by husband, Mark. Radiation oncology information was discussed and provided with written materials. Reviewed clinic procedures, radiation side effects- fatigue,skin irritation, possible pain flare, and loose stools and how to contact the clinic. Business cards provided.

She verbalized an understanding of her SIM, treatment schedule, optimal self-care, and our contact information during and after-hours for urgent needs.

Formatting of this note might be different from the original.
I called and talked to Ms. Franklin. She tells me the original pain is gone. She was having quite a bit of soreness for a couple days after the procedure, but she could tell it was not her original pain. It has subsided quit a bit. She is doing well. No concerns. I reminded her of her follow up on 10/30, but told her to contact us if she has concerns prior to her visit.
She verbalized understanding and agreement with plan.

I spent a total of 10 minutes for the patient's care on the date of the service.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, audio only conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Patient: Yvonne Kalley Franklin
DOB: 6/17/1979
MRN: U4772842

ATTENDING ONCOLOGIST:
Patient Care Team:
Purcell, William Thomas, MD as Oncologist (Hematology-Oncology)
Symonds, Lynn Katherine, MD as Oncologist (Hematology-Oncology)

IDENTIFICATION AND CHIEF COMPLAINT:
Yvonne Kalley Franklin is a 47 year old female with de novo metastatic breast cancer (ER+/PR+/HER2-) currently on OS+AI+ribociclib here for follow-up.

CURRENT THERAPY:
Ribociclib 600 mg day 1-21 q 28 days
Anastrozole 1 mg daily
Lupron q 4 weeks
Zometa q 12 weeks

ONCOLOGIC HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma
-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

-8/15/26: Start Ribociclib

INTERVAL HISTORY:
Last clinic visit 9/11/2026 .
History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with metastatic hormone receptor-positive, HER2-negative breast cancer with bone metastases who presents for oncology follow-up during her second cycle of ribociclib.

She is two weeks into her second cycle of ribociclib and reports significant improvement in overall well-being compared to the first cycle. Previously, she experienced poor appetite and frequent nausea requiring antiemetic medication, but now she has regained appetite, feels hungry, and has discontinued antiemetics without recurrence of nausea. Pain following recent outpatient spinal surgery was initially severe but has improved substantially and is now almost nonexistent. She is eating and drinking well with no issues related to oral intake.

Over the past two days, she has experienced increased fatigue, particularly in the afternoons. During the first cycle of ribociclib, she had significant exhaustion, but overall energy levels have been better this cycle until the recent onset of fatigue. She is not yet on her break week for ribociclib and anticipates starting it in about a week. She continued ribociclib through her recent spinal surgery after confirming with her care team that it was appropriate.

She underwent outpatient spinal surgery and was discharged the same day. She completed a simulation for radiation yesterday. She is also receiving Zometa for bone health and Lupron as part of her ongoing therapy.

Recent imaging includes an MRI brain, which showed one area of enhancement; follow-up imaging is planned. She has a follow-up with neurosurgery scheduled for October 7. She expresses concern about prior lesions in the cervical, thoracic, and lumbar spine, including compression fractures at T4 and T8, and wants to ensure these areas are monitored in future imaging. She recalls prior imaging showed bone lesions with more than 50% density loss in some areas and disc protrusions in the cervical spine not related to malignancy.

She is tolerating the current regimen well. She discussed with the clinician the possibility of holding ribociclib during radiation.

REVIEW OF SYSYEMS:
A complete review of systems was conducted and was negative in detail except as described above.

MEDICATIONS:
Current Medications

ALLERGIES:
Review of patient's allergies indicates:

Allergies

IMAGING:
No orders to display

ASSESSMENT AND PLAN:
Yvonne Kalley Franklin is a 47 year old female with diagnosis of de novo metastatic breast cancer.

#Metastatic Breast Cancer:
-- ribociclib 600 mg day 1-21 q 28 days
-- anastrozole 1 mg daily
-- tolerating well overall with plan to continue as long as therapy is working and they are tolerating
-- plan for restaging scans 11/2026
-- NGS testing drawn today and pending
-- follow up prior to the next cycle with labs
-- talked with rad onc- hold ribo during XRT, RN to let pt know. Will resume as planned with next cycle

#Bone mets:
-- currently on zometa q 12 weeks
-- no sign of ONJ, encourage good oral health and regular dental checks
-- Vit D 2000 IU and Calcium 1000-1200 mg daily
-- S/P 9/16/26 T8, S1 kyphoplasty and ablation - path consistent metastatic carcinoma.

#MRI brain:
-- There is a tiny 1 to 2 mm focus of enhancement along the left precentral gyrus visible on the turbo spin-echo axial images (series 1601, image 143) but not identified on the SPGR postcontrast or FLAIR images and appears somewhat linear on the sagittal turbo spin-echo reconstructions (series 1603, image 73) and most likely represents an incidental prominent vein however attention this region may be helpful on future scans. There is

no correlating enhancement or apparent vessel on the July 27, 2026 CTA.
-- no overt mets, will repeat to assess if this is a vessel with next restaging.
-- ordered for 11/2026

#pain management:
-- s/p palliative RT to right hip joint.
-- Following with palliative care for pain management.

#Genetics:
-- Genetic testing done and pending - will follow with counselor when back

Assessment & Plan
Cancer related pain
Pain significantly improved post-spinal surgery, currently minimal. Ongoing monitoring warranted.

- Monitor pain symptoms and functional status at each visit.

Drug-induced neutropenia
Neutropenia secondary to ribociclib therapy; neutrophil count 1.46, within acceptable parameters. No anemia or thrombocytopenia.

- Monitor CBC and neutrophil count regularly.
- Continue ribociclib at current dose, holding during radiation, then resume.
- Monitor for signs of infection or further cytopenias.

Fatigue
Fatigue improved compared to first cycle of therapy, recent onset of afternoon fatigue. Likely multifactorial, related to systemic therapy, recovery from surgery, and upcoming radiation. Not anemic, laboratory parameters stable.

- Monitor fatigue symptoms and provide reassurance regarding expected side effects of therapy and radiation.
- Encourage rest and self-care, especially approaching her break week from ribociclib.

DISPOSITION:
Provider follow up prior to next cycle with labs
Encouraged to call for new or worsening symptoms

Medical Decision Making is HIGH COMPLEXITY due to the following:
Chronic illness with severe exacerbation, progression, or side effects of treatment
Diagnosis poses a threat to life or bodily function in the near future
Currently on drug therapy requiring intensive monitoring for toxicity

Patients reading this note. Please be advised that the primary purpose of this note is for me to communicate other members of your medical team. Standard sentence structure is not always used. Medical terminology, abbreviations and acronyms may be used that are unfamiliar to non-health care affiliated individuals.

Current Outpatient Medications:

- acetaminophen 325 MG tablet, Take 3 tablets by mouth every 8 hours., Disp: , Rfl:
- albuterol HFA 108 (90 Base) MCG/ACT inhaler, Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing., Disp: , Rfl:
- anastrozole 1 MG tablet, Take 1 tablet by mouth daily., Disp: 30 tablet, Rfl: 11
- cholecalciferol 50 mcg (2,000 unit) capsule, Take 2 capsules by mouth daily., Disp: , Rfl:

- lidocaine viscous 2 % mouth/throat solution, Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat). (Patient not taking: Reported on 9/23/2026), Disp: 200 mL, Rfl: 1
- morphine ER 15 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- morphine ER 30 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- naloxone 4 MG/0.1ML nasal spray, Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril., Disp: 2 each, Rfl: 0
- ondansetron 8 MG tablet, Take 1 tablet by mouth every 8 hours., Disp: , Rfl:
- oxyCODONE 10 MG tablet, Take 1 tablet by mouth every 3 hours as needed for moderate pain., Disp: 100 tablet, Rfl: 0
- pantoprazole 40 MG EC tablet, Take 1 tablet by mouth daily on an empty stomach., Disp: 20 tablet, Rfl: 0
- polyethylene glycol 3350 17 g packet, Take 1 packet by mouth daily. Dissolve in 4-8 ounce water., Disp: , Rfl:
- prochlorperazine 10 MG tablet, Take 1 tablet by mouth every 6 hours as needed for nausea/vomiting., Disp: 50 tablet, Rfl: 0
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:
- ribociclib (600 mg dose) 200 MG tablet therapy pack, Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days., Disp: 63 tablet, Rfl: 2
- senna 8.6 MG tablet, Take 2 tablets by mouth at bedtime as needed for constipation., Disp: 60 tablet, Rfl: 5
- tretinoin 0.025 % cream, Apply 1 application topically 3 times a week. Apply to face., Disp: , Rfl:

No current facility-administered medications for this visit.

Oral Chemotherapy Monitoring Program

Oral chemotherapy management per FHCC CDTA

Yvonne Kalley Franklin is a 47 year old female contacted for follow up by phone for oral chemotherapy treatment monitoring.

Indication: ER/PR+, HER2- Metastatic Breast Cancer
Treatment Plan/Dose: Ribociclib 600mg PO daily D1-21/28 + Anastrozole + Leuprolide
Cycle: Subsequent Review-Refill Rx

Cycle Start Date: 09/12/26
Anticipated Next Cycle Start Date: 10/10/26

Treatment delayed or held?: Yes
Reason: XRT to sacrum planned 10/1-10/7, planning to start holding ribociclib 9/30, will miss 4 doses before her off week.

Problem list

Patient Active Problem List

Diagnosis

- Secondary malignant neoplasm of bone (HCC)
- Neck pain
- Cancer related pain
- Breast cancer metastasized to bone, unspecified laterality (HCC)
- Acute bilateral thoracic back pain
- Pathologic compression fracture of vertebra (HCC)
- Metastatic malignant neoplasm (HCC)
- Cancer, metastatic to bone (HCC)

Allergies Review of patient's allergies indicates:

Allergies

Allergen Reactions

- Fentanyl Other

Isolated PVCs
8/20/2026 states took Fentanyl without incident.
9/16/2026 took fentanyl without incident

Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?
ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole. Awaiting start of ribociclib. ACE visit 8/12/26 for increased pain. Kyphoplasty 9/16/26. Started radiation to lower spine yesterday.

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/15/2026

End Date 11/7/2026 (Planned)

History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with cancer-related pain on chronic opioids who presents for opioid dose reduction counseling.

Started radiation therapy yesterday to the lower back and sacrum at L5 and S1-S3 with a planned 5-day course. Since starting, she has had marked fatigue and nausea yesterday, requiring an antiemetic after previously stopping nausea medications while on Kisqali; she took another antiemetic dose this morning for prophylaxis.

For a couple days prior to radiation, she had mild fatigue and generalized soreness with a flu-like feeling that has since resolved. She is aware diarrhea can be a radiation side effect but has not had diarrhea.

She takes morphine 45 mg three times daily and oxycodone 10 mg three times daily, taken with morphine, decreased from 15 mg three times daily. She is interested in safely reducing opioids and has discussed tapering options with Amy Brustkern. With prolonged standing, she has diffuse low back irritation that is unpleasant but not acute pain and improves with sitting.

She uses Miralax for opioid-associated constipation; it was initially difficult to tolerate but she now has regular bowel movements.

Assessment & Plan
Cancer related pain
Chronic low back and sacral pain controlled on morphine and oxycodone with mild positional discomfort. No acute exacerbation. She requested opioid dose reduction. Discussed opioid discontinuation syndrome symptoms including jitteriness, anxiety, diarrhea, goosebumps, excessive tearing and salivation. Instructed her to contact clinic if symptoms occur rather than self-adjusting oxycodone. If withdrawal occurs, will reassess tolerance and adjust opioid dosing.

- Change oxycodone 10 mg TID to PRN for moderate or greater pain, including severe pain.
- Continue morphine 45 mg TID.
- Monitor pain control and functional impact over the next week to guide further tapering.
- Follow up 10/15/2026 at 3:00 PM; physician fellow Carly will be working in clinic.

Nausea and fatigue
Acute fatigue and nausea temporally associated with initiation of radiation therapy to L5 and S1 to S3. Etiology uncertain, possibly radiation related.

- Continue antiemetic as needed for nausea.

Opioid-induced constipation
Constipation controlled on polyethylene glycol. Bowel regimen stable. Planned to avoid preemptive bowel regimen changes during opioid taper and adjust based on symptoms and opioid dose changes.

- Continue polyethylene glycol.
- Reassess bowel regimen during opioid taper and adjust as needed.

Palliative care encounter
Ongoing palliative care focused on symptom management and opioid tapering.

- Follow up with Amy Brustkern on 10/21/2026.
- Interim palliative care follow up 10/15/2026 at 3:00 PM.

I spoke with the patient via telehealth new for this encounter. I spent a total time of 20 minutes with the patient, of which more than 50% was spent counseling as outlined in this note. Indirect time spent preparing for the visit, charting, and care-coordination was 10 minutes for total time spent 30 minutes.

Oncology Telephone Triage Note

Subjective / Visit Information:

Reason for Call: Vomiting and Nausea

Assessment and Plan:

Call Summary: Patient is on her day 2 of radiation. She had nausea after her first dose of radiation, after her second dose today she started to vomit. She has had 3 episodes of emesis since this afternoon. She denies fevers, chills, abdominal pain, dizziness, feeling like her heart is racing, SOB, CP, urinary or orther GI symptoms. She reports that she has not eaten since this morning and has been drinking minimally . She took Compazine this morning and took Zofran right before she called triage. Recommended that she let the Zofran set in. If she remains nauseated, take another Compazine. If she has another episode of emesis we could consider doing hydration. State we would call the patient back in 45 minutes to check in. Patient reporting feeling a little better and will take another Compazine. Sent patient information about Nausea and Radiation Nutrition via MyChart.

Additional documentation may exist in Flowsheets or Education Activity

GENETIC TEST RESULT - Phone call

I called on 10/5/2026 and spoke with Yvonne Kalley Franklin to disclose the results of her recent germline (inherited) genetic testing.

Result: NEGATIVE. This test did not identify any pathogenic variants known to cause disease.

Lab: Invitae
Test: Hereditary Breast Cancer Guidelines-Based Panel (13 genes total)

Genes Analyzed: ATM*, BARD1, BRCA1, BRCA2, CDH1, CHEK2, NF1*, PALB2, PTEN*, RAD51C, RAD51D, STK11, TP53

This result has the following implications for Yvonne:

1. This is a normal result. The reason for Yvonne's personal history of breast cancer remains unknown. This negative result greatly reduces the likelihood of a genetic cause.

2. This result greatly reduces the likelihood of a cancer predisposition syndrome in Yvonne.

3. This result does not inform/change current recommendations for her cancer treatment.

4. We discussed that Yvonne's genetic testing only covered genes associated with breast cancer. There are several of the genes above that overlap with risks for ovarian, prostate, pancreatic, melanoma, and some other cancers. However, more cancer-related testing is available to her.Yvonne is aware up to 70 other cancer genes could be assessed for free by Invitae until March 3, 2027. Yvonne can contact me if she is interested. At this

time, she is not interested in expanded testing.

5. No additional germline genetic testing is recommended for Yvonne at this time. She is recommended to follow-up with our genetics clinic in 3-5 years to see if additional genetic testing is available and/or recommended (scheduling # 206-606-6990).

6. Yvonne has the possibility of enrolling in clinical DNA biobanking for future genetic testing. Yvonne is eligible as an established patient at Fred Hutch based on her underlying diagnosis. There would be no extra charges for Yvonne to clinically bank their DNA. If Yvonne voices interest in the program, I will place a referral for them and coordinator will reach out to provide more information on the procedure, obtain consent, and schedule the blood sample collection. The coordinator can assist with answering Yvonne's questions.

1. Referral placed today.

This result has the following implications for Yvonne's relatives:

1. Yvonne's relatives are encouraged to share the family history of cancer(s) with their PCPs to help receive personalized recommendations for cancer screening. Yvonne is encouraged to share a copy of her testing report with her relatives as well.

2. Genetic testing is NOT recommended for Yvonne's relatives who are unaffected (ie. No cancer histories) since we did not identify a clear genetic cause for Yvonne's cancer.

3. Yvonne's close female relatives, such as her daughter and mother, are encouraged to talk with their doctors about increased breast cancer surveillance (starting at age 37) based on the family history. The National Comprehensive Cancer Network (NCCN) recommends that for individuals at greater than 20 percent average lifetime risk of invasive breast cancer, screening recommendations include:

1. Clinical breast exams: Every 6 to 12 months starting 10 years younger than the youngest breast cancer case in the family;
2. Mammograms: Every year starting 10 years younger than the youngest breast cancer case in the family; and
3. Breast MRIs: Every year starting 10 years younger than the youngest breast cancer case in the family.

All of Yvonne's questions were answered over the phone today. I will send a copy of this summary letter and the genetic testing result to Yvonne. She may contact our clinic if questions about the results arise in the future.

Pt sent in a my chart message regarding N/V post her radiation tx.
Spoke with pt today while in the clinic.
RN had instructed pt to take Zofran an hour prior to radiation tx. Then post radiation, can take compazine as needed. Recommended to take Zofran and compazine RTC until radiation is complete to help. Pt stated she did not expect to have N/V and has been miserable with this. Pt was good with plan with taking antiemetics RTC until radiation is complete. Pt has a fup visit with rad onc provider on Wednesday 10/7/26. Instructed to call back if antiemetics do not help.

?

History of Present Illness
Yvonne Kalley Franklin is a 47-year-old female with metastatic breast cancer to bone status post T8 and S1 kyphoplasty with ablation on 09/16/26 who presents for follow-up for residual neck stiffness and questions about interval cervical and brain imaging.

Spinal Metastatic Disease and Postoperative Course:

- Diagnosed with metastatic breast cancer to bone following evaluation for back pain and pathologic vertebral compression fractures in July 2026
- Underwent T8 and S1 kyphoplasty with ablation on 09/16/26; pathology confirmed metastatic carcinoma of breast origin
- Marked improvement in pain and mobility since surgery
- Ambulates 4-6 miles per day
- Remains on morphine and oxycodone, currently tapering

Neck and Upper Back Symptoms:

- Persistent mild neck and upper back stiffness and tightness
- Symptoms substantially improved compared to prior months
- No sharp pain
- No arm pain, radiation, numbness, tingling, weakness, bowel or bladder dysfunction, or balance problems

Pain Management:

- Continues to use morphine and oxycodone, currently tapering doses

Imaging and Surveillance Concerns:

- No cervical spine imaging since July 2026
- Requests surveillance cervical spine imaging, as upcoming PET-CT in November 2026 may not include the neck
- Requests second opinion on brain MRI from 09/24/26, which showed a 1-2 mm punctate focus described as possibly a vein

Oncologic Therapy and Radiation Side Effects:

- Currently on ribociclib
- Completing sacral radiation
- Experienced nausea and vomiting early in radiation course, now improved

IMAGING:

Results
Radiology
Cervical spine MRI (07/2026): No new lesion.
Brain MRI (09/24/2026): No intracranial metastatic disease. Single punctate focus in the left precentral gyrus, likely vascular. (Independently interpreted)

Pathology
T8 and S1 vertebral pathology (kyphoplasty/ablation specimen) (09/16/2026): Metastatic carcinoma consistent with breast primary.

IMPRESSION / ASSESSMENT:

ICD-10-CM

1. Secondary malignant neoplasm of bone (HCC) C79.51 CT C Spine w Contrast

CANCELED: CT C Spine w Contrast

CANCELED: CT C Spine wo Contrast

CANCELED: CT C Spine w Contrast

CANCELED: CT C Spine wo Contrast

Assessment & Plan
Secondary malignant neoplasm of bone
Osseous metastatic breast carcinoma involving spine and sacrum, managed with ribociclib and completing sacral radiation. No acute neurologic deficits.

- Order CT cervical spine to pair with November PET/CT for cervical surveillance.
- Coordinate CT cervical spine with November imaging.
- Discuss timing and need for repeat brain MRI surveillance with Medical Oncology.
- Follow up to review November imaging results around Thanksgiving, approximately one week after scan.

Pathologic vertebral compression fractures
Pathologic vertebral compression fractures secondary to metastatic breast cancer, status post T8 and S1 kyphoplasty with ablation, with marked symptomatic improvement and increased mobility. Spine stabilized after cement augmentation.

- Continue current oncologic treatment plan including post-procedure radiation as coordinated by Dr. Kang and Dr. Som
- Contact oncology and spine team urgently for new severe sharp pain, radicular arm symptoms (numbness, tingling, shooting pain), or weakness.

Neck pain
Persistent but improved cervical stiffness and tightness without radicular or myelopathic symptoms; managed conservatively.

- Maintain physical activity, exercise, and neck stretching; no activity restrictions.
- Order CT cervical spine to monitor cervical involvement (attempt to pair with November imaging).
- Seek prompt evaluation for severe, intense, or new neck pain, symptoms radiating down arms (numbness, tingling, shooting pain), or weakness.

Prior EMR records reviewed as available and clinically relevant. All questions answered. Discharge and follow up instructions were discussed with the patient. The patient fully understands and is in agreement with the plan.

Number and Complexity of Problems Addressed
1 acute, uncomplicated illness or injury
1 acute or chronic illness or injury that poses a threat to life or bodily function

Amount and/or Complexity of Data to be Reviewed and Analyzed
Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported)

Risk of Complications and/or Morbidity or Mortality of Patient Management
Moderate

Portions of this chart were made using voice recognition software.

47 year old with PMH of ER/PR+, HER2- Metastatic Breast Cancer
Current tx with Ribociclib 600mg PO daily D1-21/28 + Anastrozole + Leuprolide
S/p XRT to sacrum planned 10/1-10/7

Last seen via tm 7/2026 for T1, T4, T5 and T8 vertebral bodies, and known lesions in her entire spine. Recommended urgent kypho, now s/p 9/16/26 T8, S1 kyphoplasty and ablation - path consistent metastatic carcinoma of breast origin.

Rx MS contin, oxycodone, APAP -> gradually weaning

Presents for f/u after kypho.
Completed RT on C spine and initiated tx with Ribociclib
Doing great since kypho, but residual soreness. Improved mobility and functionality. Walking 4-6 miles per day. She has residual soreness and stiffness at her neck and upper back, but greatly improved. Denies radiculopathy, bowel/bladder control.

Nervous and wanting to know we are monitoring C spine.
Also completed brain MRI "vein that popped up"

RN went to see pt prior to OTV with Dr. John Kang
Fx 5/5 to sacrum

Pt reported N/V had resolved with taking Zofran and compazine RTC during her last few txs. Pt's weight is stable. She does report her appetite is still down. She denies any skin irritation, or loose stools. She does have some fatigue in the afternoon.
Her back pain is about 3-4/10 with pain medications. She is taking Morphine ER 45mg three times a day and Oxycodone 10mg BID.
She had fup with FH med/onc on 10/23/26.

Her questions for the provider today
How will you know if radiation tx worked? What is the plan moving forward? If further tx is needed, how is that evaluated?

Above info relayed to the provider.

Subjective
She is having nausea that started last week after her second fraction. This did not seem to improve with 1 tab of Zofran. She is now taking scheduled Zofran and Compazine with resolution of her nausea.
Her pain is overall improved and she feels much better than when she first presented during the summer.

Objective

No acute distress
No increased work of breathing

ATTENDING: Purcell, William Thomas, MD
Symonds, Lynn Katherine, MD

DIAGNOSIS AND IDENTIFICATION:
47 year old female with de novo metastatic breast cancer (ER+/PR+/HER2-)

CURRENT THERAPY:
OS+AI+ribociclib

Last treatment date:

Lupron 9/25

Ribo cycle started 10/10

XRT to sacrum 10/1-10/7

SITUATION/BACKGROUND:
At last visit, Yvonne reported feeling well and provider reviewed plan to taper oxy dosing. Yvonne did not take oxy for a few days last week, though she did continue morphine. Initially she felt well, then she developed 8-9/10 pain in her mid, upper back. She typically has pain here, but this was more than usual. Pain described as achy/tender and intermittent, though pain episodes lasted a few hours at a time.

Yesterday afternoon (10/11) pain improved and is back to her baseline of roughly 3/10 pain.

Yvonne is feeling much better now than when she reached out to team, but would still like guidance on pain episodes and plan for scans.

Patient Denies:

- During period of exacerbated pain, she denies new numbness/tingling or changes to motor movement. She had no symptoms other than pain. Denies movement/event prior to pain.

Home Care Tried (if any):
Yvonne added Oxy back to pain regimen. She also used a heating pad.

PLAN & RECOMMENDATIONS:
We discussed that it's reassuring pain has improved and from conversation, unlikely she needs immediate assessment. Discussed scheduled imaging on 11/16. Plan for RN follow up with providers for recommendations on scan timing or other concerns.

Return Precautions:
Call back if: fever (100.4 F or above), new or worsening symptoms, shortness of breath, dizziness, and any other questions or concerns

ER/911 if: severe shortness of breath, chest pain, loss of consciousness, new severe pain, and seizures

Action Taken: Provider Notified

Patient Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, and No further questions

FHCC Palliative Pharmacist Visit

ID/CC: Yvonne Kalley Franklin is a 47 year old female with metastatic breast cancer presenting for followup of cancer-related pain management.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?
Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: No one else present
Assessment & Plan .
Assessment & Plan
Cancer related pain
Chronic cancer related pain remained well controlled on morphine ER TID and oxycodone 10 mg TID. No clinically significant opioid induced constipation. Functional status and mobility remained high.

- While at her last visit she had hoped to taper off the IR oxycodone, she has continued to require her previous dose of 10mg PO TID. Counseled that there may be a component of increased pain related to her radiation and she may be able to taper further in the future, as radiation just finished last week. Pain is controlled at current dose. Continue oxycodone 10 mg PO TID.
- Continue morphine ER 45mg TID
- Resume prior constipation regimen for opioid induced constipation prophylaxis.
- Maintain safe medication storage.
- Follow up with Amy Brustkern next Wednesday.
- Contact clinic via MyChart if pain worsened, interfered with activities of daily living, or if adverse effects developed.

Subjective :
History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with chronic back pain from metastatic breast cancer who presents for follow-up of back pain and opioid use after recent radiation therapy.

She attempted to taper oxycodone but developed increased aching in the upper to mid back around the time of radiation and returned to oxycodone 10 mg three times daily with improvement; pain is currently controlled and she does not feel she needs a higher dose. Radiation to the lower back was completed Wednesday of last week, about 1 week ago. She had nausea and vomiting during radiation and expected diarrhea but did not develop diarrhea.

She denies constipation. She stopped her usual constipation-prevention regimen in anticipation of radiation-related diarrhea, but diarrhea did not occur; she plans to restart her prior routine now that she is back on the same opioid dose.

She remains functional and active, walking 4 to 6 miles daily and doing light weight training a couple times per week. She notes stiffness in the area of prior vertebral cementing and plans follow-up with Dr. Som. She has enough oxycodone at home for at least a couple of weeks and stores medications in a safe place.

Objective :.
Vitals (EpicACT:MR_ROOMING,RunParams:STARTUPSECTION=UW_SEC_MR_VITALS_EXTENDED): There were no vitals taken for this visit.
Physical Exam

Alert, well appearing, no distress or visible discomfort
Breathing comfortably on room air

Carly Magnusson, MD
Palliative Care fellow

I spoke with the patient via telehealth new for this encounter. I spent a total time of 30 minutes with the patient, of which more than 50% was spent counseling as outlined in this note. Indirect time spent preparing for the visit, charting, and care-coordination was 10 minutes for total time spent 40 minutes.

FRED HUTCH SOCIAL WORK CLINICAL NOTE

Reason for referral to Social Work: Assessment and Counseling
Encounter method: Telehealth: I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed. Patient was located at home. Provider was located at on-site location.
Present at the visit: Patient
--
Confidentiality & medical record disclosure:
At the start of the session, the patient was informed that this visit and any relevant information will be documented in their medical record. The patient was also reminded that confidentiality is maintained except in cases where disclosure is legally required, such as suspected abuse of a vulnerable individual, risk of harm to self or others, or court-ordered requests. The patient acknowledged understanding of this information.

Encounter Summary:
Yvonne Kalley Franklin is a 47 year old female and is being seen at Fred Hutch for de novo met breast cancer with osseous mets, treated with OS+AI+ribociclib. Their primary treating provider is Dr. Katherine Symonds, and they were referred to social work by Palliative Care PA Amy Brustkern.. The primary concerns that the patient reported were anxiety.

Patient was referred by FHCC Palliative Care Team in late September, due to anxiety around coping with new diagnosis and starting treatment. At the time of referral one month ago, Amy Brustkern, PA noted that patient's expression of anxiety was improving as she learned disease had stabilized and pain was progressively better managed. At the time of this visit, patient observed, "Today, I actually feel the best I've felt since this whole thing started." She explained that her symptoms of back pain started in February and she was diagnosed in July. Her pain had reached levels where it was set off by almost any movement. She described her pain as 0/10 today with

movement. She has maintained energy to maintain her busy family schedule (several sports with two kids). She also observed that her experience of anxiety is, "better than I thought it might be," since she identified as an anxious person prior to illness. She stated, "I feel pretty positive about the situation." She attributes this in part to having few side effects with treatment (nausea is now controlled and symptoms of menopause are less severe than she anticipated).

Briefly discussed her children's coping (ages 9 and 11), and helpful information she received from Child Life. She currently feels her children are coping well with limited disruption to their lives by patient's cancer/treatment.

Discussed resources like support groups and patient expressed some interest in Team Survivor NW. Will send information in MyChart follow-up message.

Identified Goal for Quality of Life
"Hope to eventually be able to get off pain medication if possible."

Patient is aware of Social Work role and services and will reach out to Social Work for support and resource assistance as needed. Patient does not report safety concerns.

--
Assessment:

Screening scores

PHQ-9 depression screening history:
PHQ9 Total ScoresNo data found in the last 100 encounters.

No data recorded
PHQ-9 score indicates: Patient did not complete the PHQ-9 screening today
PHQ-9 Flowsheet (EpicACT:UCW_DOCUMENT_FLOWSHEET,RunParams:5001280143)

GAD-7 anxiety screening history:
GAD7 Total ScoresNo data found in the last 100 encounters.

GAD-7 score indicates: Patient did not complete the GAD-7 screening today
GAD-7 Flowsheet (EpicACT:UCW_DOCUMENT_FLOWSHEET,RunParams:5001541000)

Suicide assessment
Suicide assessment not indicated today.

Mental status exam
Appearance: Good grooming and hygiene
Behavior: Appropriately interactive w/ others
Speech: Coherent, Normal rate, Normal rhythm
Affect: Appropriate
Mood: Patient reported "I feel pretty positive about the situation"
Thought Form/Content: Coherent, Logical, Organized
Attention/Concentration: Good

Memory: Normal
Judgement/Insight: Intact

Psychosocial background

Brief social history: Patient lives in Kirkland with her spouse and two children (Kenzie, 11 and Cooper, 9). Her mother and brother/spouse live in the area. She continues working full time from home, with a flexible employer through diagnosis and treatment course.

Mental health history: None identified.

Psychotropic medications/updates: None

Substance use history: Not assessed

Previous steroid use and adverse reaction: Not discussed

Coping skills and strengths: Patient and family enjoy outdoor and sports activities together, patient finds her work is a good distraction and something that she finds satisfaction doing, self-aware and expressive, uses support resources as needed.

Active social support system: Family and community friends.

Relationships and intimacy: Did not discuss

Barriers to activation: pain in spine (today is at a 0/10 with medication regimen), anxiety also improved with physical symptom improvement.

Spiritual/religious or existential considerations: Not discussed

Cultural practices and considerations relating to treatment: None identified

Loss history and risk of complicated grief: Discussed grief/loss in transition around new diagnosis and treatment.

Treatment-related logistics/concerns:

Practical/logistical/financial concerns: Not identified

Caregiver plan for treatment: N/A, patient is independently functional

Lodging/housing plan for treatment: Home with family

Travel/lodging benefit for treatment: N/A

Communication considerations:
None identified

Advance care planning: Not discussed

Release of Information (ROI): N/A

--

Themes and therapeutic approaches:

Social Work action items:
MSW introduced self and role as resource-linker, advocate, and supportive counselor, Provided contact information, Provided counseling support, Sent follow-up [MyChart or email] message with resources discussed, and Discussed coping and supports for patient and caregivers

Themes explored:
Adjustment to diagnosis/treatment, Communication, Grief/loss, Hopes, values, goals, Mood concerns/symptoms, Physical challenges/symptoms, and Purpose/meaning

Therapeutic approaches used:
Cognitive behavioral therapy (CBT) skills, Grief therapy (anticipatory, preparatory, and/or bereavement support), Psychosocial assessment, and Supportive counseling

--

Plan:
MSW appreciated the opportunity to connect with this patient. Patient is aware of Social Work role and services.

No follow up planned at this time; patient/caregiver will reach out as needed.

Time Spent - Direct Care: 30 minutes
Time Spent - Indirect Care: 30 minutes

FRED HUTCHINSON CANCER CENTER
BREAST ONCOLOGY RETURN VISIT

ID/CC: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) currently on OS+AI+ribociclib here for follow-up

ONCOLOGY HISTORY:
-February 2026: Developed back pain which got progressively worse
-7/1/26: MRI spine showed expansile lesions in T1, T5, T8-T10 with expansile element in T10
-7/13/26: CT chest/abdomen/pelvis showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules.
-7/21/26: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
-7/22/26: L breast core biopsy showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30% , Right axilla LN biopsy showed metastatic carcinoma
-7/24/26: Right iliac crest biopsy showed metastatic carcinoma
-7/27/26-7/30/26: Admitted for pain control, she received palliative radiation with 800 cGy over 1 fraction to the right hip joint, started on lupron and anastrozole, also received zometa as an inpatient

-8/15/26: Started Ribociclib

Interval History:
-Pain is significantly better after her procedure
-Remains very active, walking several miles per day
-Very interested in the vaccine trial
-Nausea is well managed
-Fatigue is present
-The remainder of her ROS is negative

ROS: Complete ROS was reviewed and was negative unless stated above in the HPI

ECOG: 0 (prior to diagnosis)

ASSESSMENT/PLAN: Patient is a 47 yo premenopausal woman presenting with de novo metastatic breast cancer (ER+/PR+/HER2-) currently on OS+AI+ribociclib here for follow-up

#Breast Cancer: Patient presented with several months of back pain. An MRI on 7/1/26 showed expansile lesions in T1, T5, T8-T10. Subsequent CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout spine and pelvis and left 11th rib fracture as well as a few scattered lung nodules. PET CT on 7/21/26 showed FDG avid lesions in L breast, R axilla, and bones. Left breast core biopsy on 7/22/26 showed invasive lobular carcinoma, ER+ (91-100%), PR+ (91-100%), HER2- (1+ by IHC), Ki-67 21-30%. Right axillaary LN biopsy showed metastatic carcinoma. Right iliac crest biopsy also showed metastatic carcinoma. She subsequently admitted for pain control and started on lupron+anastrozole. She has now started ribociclib which she is tolerating well. ANC is low today so anticipate hold and rechecking labs in 1 week. We will plan to continue. We spent the majority if the visit discussing treatment strategies and approaches. Of note, she is POSITIVE for an activating mutation in PIK3CA (p.C420R) so will be a candidate for capivasertib. She is very interested in the vaccine trial: I have sent message to team.
-Continue lupron q4 weeks
-Continue anastrozole daily
-Hold ribociclib as above
-Repeat PET CT due November 2026 (scheduled)
-Scheduled to meet with nutrition
-Will send next generation sequencing on tumor sample (pending)

#pain management: s/p palliative RT to right hip joint and s/p T8 and S1 kyphoplasty with ablation on 09/16/26 . Following with palliative care for pain management..

#Bone Mets:
-Continue zometa q4 weeks
-Continue calcium and vitamin D

#Genetics: Genetic testing recommended in the setting of metastatic breast cancer

Return: 1 month

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of

treatment options for vertebral augmentation.

INTERVAL HISTORY
S/p kyphoplasty T8, S1 unipedicular kyphoplasty and ablation
S1 biopsy on 9/16/26

Today she feels better. She still reports a 7/10 pain in the mid thoracic back, but is able to breathe significantly better. There is tightness in the lower back, but much better mobility with bending.

HISTORY OF PRESENT ILLNESS
Ms. Franklin is a 47 y.o F patient was recently admitted for pain control of significant metastatic disease. MRI demonstrates spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention was indicated per NSGY, and patient was discharged following adequate pain control. She has received outpatient radiation therapy three weeks ago. Since 3 weeks ago, her pain is significantly better in her neck.Last week she reported significant pain with motion in the upper spine can get to an 8 or 9. At that time, she can't bend, turn, and she is limiting her motion, as well as limiting breathing.

IMAGING STUDIES
S/p kyphoplasty T8 and S1

[image]

Exam: No tenderness on palpation, but fiducial placed where she feels the pain most.

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain and since kyphoplasty has better breathing and mobility.

She has continued 7/10 pain in the midthoracic spine and tightness in lower back.However no pain on stiff palpation suggesting it is deeper.

- Plan new X-rays at sites, MR thoracic and L spine to pair with staging studies.
- F/u in 1 month to evaluate if further intervention will help her such as at L5 and in the remaining thoracic fractures.

Avik Som, MD, PhD
UW Interventional Radiology

I spent 30 minutes on exam and care with the patient.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, audio only conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

- Tingling

HISTORY OF PRESENT ILLNESS AND REVIEW OF SYSTEMS

This is a 47-year-old female with a history of metastatic breast cancer with metastases to the T-spine with associated compression fractures, presenting with intermittent shooting tingling down the back of her legs.

Patient states that starting yesterday, when she looks down from a standing position she occasionally gets a electric feeling that goes down the back of her legs. She comes in today given concern for progression of metastases in her spine.

She denies any other changes in sensation, weakness in her legs, arms or trunk, numbness, inability to walk, trouble with coordination, bowel or bladder incontinence, saddle anesthesia.

She has spinal CTs scheduled for the 16th of this month, and is going to schedule a new MRI within the next 1 to 2 weeks.

ED COURSE/MEDICAL DECISION MAKING

This is a 47-year-old female with a history of metastatic breast cancer with metastases to the T-spine with associated compression fractures, presenting with intermittent shooting tingling down the back of her legs.

Patient arrives hemodynamically stable, well-appearing, with above history and physical exam findings.

In the setting of her known metastatic disease, I considered new spinal fractures, spinal stenosis, new metastases, spinal epidural abscess, cauda equina, radiculopathy, among other diagnoses.

Based on my above physical exam specifically with no new focal neurological deficits that I can elicit quite reassuring against the above etiologies particularly in setting of no new change in sensation, weakness, change in bowel or bladder habits.

Through shared decision making, discussed pros and cons of additional imaging here in the emergency department including a CT versus MRI. Patient already has this imaging scheduled on an outpatient basis, and I do not think there is an emergent need for additional imaging at this time. Patient amenable to the idea of obtaining outpatient imaging unless she develops new focal neurologic deficits in which case she return to the

emergency department

Based on the evaluation today, it is my clinical judgment that the patient can be safely managed as an outpatient with PCP follow-up. The patient was asked to return to the ED immediately for any new or concerning symptoms, or for worsening of existing symptoms. Patient was in agreement, endorsed understanding, and questions were answered.

Medications Given in the ED:
Medications - No data to display

CLINICAL IMPRESSION AND DISPOSITION (Link) (EpicAct:ER_DISPO)

Clinical Impressions:

[M48.50XD] Pathological compression fracture of vertebra with routine healing, subsequent encounter

[C79.51] Metastasis to spinal column (HCC)

[R20.2] Tingling in extremities

No follow-up provider specified.

Patient was given scripts for the following medications.

Referral Reason: Cancer-related pain, Symptom management (non-pain), and Emotional support/coping

ID/CC: 47 year old female with de novo metastatic breast cancer with osseous metastases. Diagnosed 07/2026. Admission 7/27/26 for pain. Currently on Lupron and anastrozole. Awaiting start of ribociclib. ACE visit 8/12/26

for increased pain. Kyphoplasty 9/16/26. Completed XRT Fx 5/5 to sacrum 10/2.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

Treatment goal [No plan goal]

Plan Name OP Ribociclib + Endocrine Therapy

Start Date 8/15/2026

End Date 11/7/2026 (Planned)

Addressed during this visit: Patient's narrative, Symptom management, Optimizing quality of life, and Education about palliative care
Participants: Patient

History of Present Illness
Yvonne Kalley Franklin is a 47 year old female with metastatic breast cancer to bone on ribociclib who presents for symptom management follow-up.

After completing lower back radiation, treatment-related neutropenia led to interruptions in ribociclib dosing. Ribociclib was restarted about 2 days after radiation completion when neutrophils were 0.9, then declined to 0.67. About 1.5-2 weeks ago, Dr. Simons recommended holding the last week of ribociclib plus the scheduled off-week; after a week off, neutrophils increased to 0.77.

Cancer-related pain is overall well controlled but returned to the pre-radiation regimen. Morphine ER 45 mg three times daily is ongoing, with oxycodone taken with morphine including at bedtime. Mornings are pain-free, with pain emerging around midday and worsening with activity; primary location is mid-back. Prior x-rays showed a T5 compression fracture. She reports that the area of pain is in the mid-back. A new tingling sensation with some pain prompted an ER visit over the weekend; she was told ok to wait for upcoming imaging. Tingling has not been progressive or effecting function.

Unintentional weight loss continues to the lowest weight despite increased intake, with early satiety and intermittent stomach upset. One abrupt, brief episode of emesis occurred the other day; no persistent nausea over the last ~1.5 weeks off ribociclib. During and after radiation, nausea with vomiting occurred. No diarrhea, and bowel movements are regular without constipation. Ondansetron and prochlorperazine are available at home. Sleep is good. One acupuncture session was completed last Friday, with a pause for a week while monitoring tingling symptoms.

Goals of Care
I acknowledged uncertainty related to fluctuating counts, treatment holds, new sensations, and upcoming PET imaging, and I reinforced my role in supporting her through symptom management and decision making as information is gathered. She shared that she feels physically well overall and is hopeful the scans will be reassuring, though she has anxiety about results. I shared that her current clinical trajectory and tumor marker improvement are reassuring, while also noting that interpretation of early imaging may need to account for recent radiation and interruptions in systemic therapy. She stated she is not expecting miracles on the first scan and is hoping for stability and evidence of response.

She described prioritizing maintaining normal life and family routines, including caring for her children and returning to work as a helpful distraction with supportive leadership and flexibility. She is taking things day by day and would take additional time off if needed. She identified an upcoming family trip to Hawaii for Thanksgiving as

an important positive focus.

No discussion occurred regarding code status, CPR, intubation, POLST or MOLST, advance directives, or surrogate decision maker.

Assessment & Plan

Cancer pain management

Mid-back pain from T5 compression fracture, controlled on morphine ER and oxycodone. Activity-related midday breakthrough pain. MRI pending to guide intervention.

- Continue morphine ER 45 mg PO TID. RF sent today.
- Use oxycodone PRN breakthrough pain only, including overnight if needed. Hold bedtime dose to assess need.
- Defer opioid changes pending MRI and interventional plan.
- Obtain MRI spine.
- Discuss with oncology whether vertebral augmentation is appropriate for the T5 compression fracture.

Abnormal weight loss

Ongoing unintentional loss with early satiety, likely treatment-related. Not felt due to progression but continue to monitor closely.

- Small frequent high-protein meals and snacks. Add protein shakes. Keep preferred high-protein foods available.
- Contact palliative care if ongoing loss despite nutritional measures to discuss appetite-stimulating medications.

Nausea

Intermittent nausea/vomiting with recent lower back radiation and ribociclib (Kisqali), improved off ribociclib. No persistent nausea.

- Continue PRN ondansetron and prochlorperazine.
- With ribociclib restart, consider morning ondansetron for decreased appetite or subtle nausea.
- Small frequent meals to reduce fullness and vomiting.

Metastatic breast cancer to bone

Osseous metastatic disease with normalized tumor markers. PET and MRI spine pending. T5 compression fracture contributing to pain.

- PET imaging pending and CT CAP; review with oncology.
- Obtain MRI spine.
- Pause acupuncture pending scans and symptom clarification. Resume if helpful without added stress.
- Coordinate with oncology re scan interpretation and next steps.

Treatment-related neutropenia

Worsened after radiation and ribociclib, slowly recovering. Treatment held per oncology.

- Hold ribociclib pending count recovery per Dr. Symonds (Oncology). Currently on off week.
- CBC Friday.
- Urgent evaluation for fever or infectious symptoms.

Anxiety

Situational scan and treatment-related anxiety, coping with routine and family travel.

- Supportive counseling and normalization of scan-related worry.

- Reach out for worsening anxiety or symptom burden.

Pain
Pain Source: Cancer
Opioid Prescriber: Palliative
Long Acting Opioid (strength/dose/qty): Morphine ER 45 mg TID
Short Acting Opioid (strength/dose/qty): Oxycodone 10-15 mg every 3-4 hours PRN for pain. Currently using 10 mg TID
Adjuvant Meds: Tylenol 1000 mg TID
MED: 180
PMP Check (08/04/26): Yes

Opioid agreement:signed Yes

DISPOSITION:
Follow up visit in 4-6 weeks

FUNCTIONAL ASSESSMENT:
ECOG Performance Scale: (1) Restricted in physically strenuous activity, ambulatory and able to do work of light nature
Palliative Performance Scale:
Prognosis: Uncertain of prognosis

Subjective
PALLIATIVE CARE DISCUSSION:
Social History: Lives in Kirkland with husband Mark. 2 children ages 9 and 11. Corporate job. Working full time but planning to take the next month to treat pain and start treatment.
Understanding/Perspective of Illness: Metastatic disease. Treatment is palliative
Hopes, Strengths And What Brings Life Meaning Or Purpose: More time with 2 kids and family. Continuing to work and do the normal things.
Fears, Concerns, Worries: Worries about pain and controlling symptoms
Communication Preferences: Appreciates detail focused information. Uutilizes MyChart, telehealth as appropriate.
Role Of Spirituality, Faith, Religion, Spiritual Assessment:

Past Experience With Serious Illness/Hospice:
Acceptable Quality Of Life:

Advance Care Planning
FHCC ACP

Legal Next of Kin: Husband Mark
DPOAHC:
POLST:
Living Will/Advanced Directive:

Objective
GENERAL INFORMATION:
Care Team: Patient Care Team:
Paras, Leilani D, MD as PCP - General (Family Practice)
Purcell, William Thomas, MD as Oncologist (Hematology-Oncology)
Shepherd, Annemarie, MD (Radiation Oncology)

Kang, John, MD as Radiation Oncologist (Radiation Oncology)
Symonds, Lynn Katherine, MD as Oncologist (Hematology-Oncology)

Brustkern, Amy K, PA-C as Physician Assistant (Palliative Medicine)
Palko, Raymond, RD as Dietitian (Dietitian-Nutritionist)

IMPORTANT CLINICAL HISTORY:
Imaging: 7/27/26 MRI C-T-L
IMPRESSION

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.
Pathology: 7/24/26 A) Right iliac crest, biopsy:

- Metastatic carcinoma.

Treatment History: Lupron + AI. Awaiting approval for Ribociclib.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0.
Innumerable bony foci including compression fractures of T4, T8, L5.

7/15/26 Dx imaging: Left Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.
Right Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding. At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding.

7/21/26 PET/CT:
Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm. No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes. Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease. * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic

disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes. * Moderately avid right axillary lymph node, concerning for metastatic.* Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast.
7/22/26 Left breast bx 1:00 7N: ILC G2 ER (91-100%) PR (91-100%) Her2 (1+) Ki67 21-30%

Right axillary LN: Metastatic carcinoma, Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary

7/24/26 Right iliac crest bx: metastatic carcinoma

7/27/26 CT Full spine * Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

7/27/26 CT head/neck: Normal head CT. No acute infarct, hemorrhage or mass effect. Normal CTA head. No high-grade stenosis or occlusion. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria
7/27/26 MRI Spine: No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

7/28/26 XR T spine: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

7/28/26 Radiation Oncology consult inpt- plan to start radiation

7/29/26 Oncology consult inpt- start Lupron 7.5mg, anastrozole 1mg daily, zometa 4mg

7/29/26 Palliative radiation to C4-T11 800cGy in Fx

8/14/26 Start Ribociclib 600mg, 3 wks on, 1 wk off
-09/16/26 [Dr. Som] IR kyphoplasty, ablation of T8 and S1.

Secondary malignant neoplasm of bone (HCC)

- acetaminophen 325 MG tablet, Take 3 tablets by mouth every 8 hours., Disp: , Rfl:
- albuterol HFA 108 (90 Base) MCG/ACT inhaler, Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing., Disp: , Rfl:
- anastrozole 1 MG tablet, Take 1 tablet by mouth daily., Disp: 30 tablet, Rfl: 11
- cholecalciferol 50 mcg (2,000 unit) capsule, Take 2 capsules by mouth daily., Disp: , Rfl:
- citalopram 20 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:
- cyclobenzaprine 10 MG tablet, TAKE 1/2 TO 1 TABLET BY MOUTH THREE TIMES DAILY AS NEEDED FOR MUSCLE SPASMS, Disp: , Rfl:
- Lidocaine 10 % cream, Apply 1 g topically., Disp: , Rfl: 4
- lidocaine viscous 2 % mouth/throat solution, Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat)., Disp: 200 mL, Rfl: 1
- meloxicam 15 MG tablet, , Disp: , Rfl:
- morphine ER 15 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- morphine ER 30 MG ER tablet, Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours, Disp: 90 tablet, Rfl: 0
- naloxone 4 MG/0.1ML nasal spray, Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril., Disp: 2 each, Rfl: 0
- ondansetron 8 MG tablet, Take 1 tablet by mouth every 8 hours., Disp: , Rfl:
- oxyCODONE 10 MG tablet, Take 1 tablet by mouth every 3 hours as needed for moderate pain., Disp: 100 tablet, Rfl: 0
- pantoprazole 40 MG EC tablet, Take 1 tablet by mouth daily on an empty stomach., Disp: 20 tablet, Rfl: 0
- polyethylene glycol 3350 17 g packet, Take 1 packet by mouth daily. Dissolve in 4-8 ounce water., Disp: , Rfl:
- prochlorperazine 10 MG tablet, Take 1 tablet by mouth every 6 hours as needed., Disp: , Rfl:
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:
- ribociclib (600 mg dose) 200 MG tablet therapy pack, Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days., Disp: 63 tablet, Rfl: 2
- senna 8.6 MG tablet, Take 2 tablets by mouth at bedtime as needed for constipation., Disp: 60 tablet, Rfl: 5
- tretinoin 0.025 % cream, Apply 1 application topically 3 times a week. Apply to face., Disp: , Rfl:

PHYSICAL EXAMINATION:
Not completed today as visit TH.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home

Present with patient: No one else present

I spent a total of 40 minutes for the patient's care on the date of the service.

Oral Chemotherapy Monitoring Program

Oral chemotherapy management per FHCC CDTA

Yvonne Kalley Franklin is a 47 year old female contacted for follow up by phone for oral chemotherapy treatment monitoring.

Indication: ER/PR+, HER2- Metastatic Breast Cancer
Treatment Plan/Dose: Ribociclib 400mg PO daily D1-21/28 + Anastrozole + Leuprolide
Cycle: Subsequent Review-Refill Rx

Cycle Start Date: 10/10/26
Anticipated Next Cycle Start Date: 11/07/26
Dose Modifications: DR from 600mg to 400mg d/t persistent neutropenia

Treatment delayed or held?: Yes
Reason: Last dose was 10/22. Held day 14-21 by breast onc d/t low ANC. (day 21 = 10/30/26). Skipped 8 doses this cycle.

Monitoring: OSH ANC 1.6 today.

Interventions and Follow-up Plan:

Plan:

OSH labs show ANC 1.6, permissible to restart ribo tomorrow on her usual schedule. Will dose reduce to 400mg 21/28 d/t prolonged neutropenia.

Next labs already ordered by breast onc for 11/20 with return visit and lupron.

Understands these are mid-cycle labs and that she may need an additional blood draw ~12/3.

Pt already has a 600mg dose pack and will use that for this cycle. New Rx for DR sent to pharmacy today.

A prescription for ribociclib will be sent to CVS Specialty pharmacy. Future refills will be managed by the FHCC Oral Chemotherapy Service.

Follow-up Dates:
Date of next outreach:: 11/23/26

Next Outreach type:: Phone
Date of next pharmacist lab review:: 11/20/26
Next refill due: 01/29/27
Reference: MONALEESA-2

INTERVENTIONAL RADIOLOGY OUTPATIENT CONSULT NOTE

REFERRING PHYSICIAN
Amin Gautam, MD

IDENTIFICATION AND CHIEF COMPLAINT
Yvonne K Franklin is a 47 year old female patient who is referred to interventional radiology for consideration of treatment options for vertebral augmentation.

INTERVAL HISTORY
She has since felt some tingling pain with her neck bending and received an urgent MRI which showed no acute findings. At multidisciplinary conference, her symptoms were concerned to be for Lhermitte's sign.

S/p kyphoplasty T8, S1 unipedicular kyphoplasty and ablation
S1 biopsy on 9/16/26. Today she feels about the same. She reports a 2-3 with pain medication and 8/10 pain without it in the mid thoracic back.

HISTORY OF PRESENT ILLNESS
Ms. Franklin is a 47 y.o F patient with breast cancer s/p kyphoplasty T8, S1 unipedicular kyphoplasty and ablation, S1 biopsy.

IMAGING STUDIES

[image]
ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with recently diagnosed metastatic breast cancer and extensive spinal metastases. Since receiving radiation therapy, she has improved in regards to her pain and since kyphoplasty has better breathing and mobility. She has continued pain in the midthoracic spine and tightness in lower

back.However no pain on stiff palpation suggesting it is deeper/ oncologic.

Her new tingling pain with head motion is concerning for L'Hermitte's sign based on discussion with multi-disciplinary clinic.

- F.u after staging studies in ~ 1 month
- Referral to neuro-oncology for concern for L'Hermitte's sign as per multi-disciplinary discussion.
- C- spine is cleared from the MRI as per multi-disciplinary review.

Avik Som, MD, PhD
UW Interventional Radiology

I spent 30 minutes on exam and care with the patient.

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, audio only conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: No one else present

Electronically signed by Avik Som at 11/13/2026 4:59 PM PST

Telephone Encounter - Kaci E - 11/13/2026 3:10 PM PST

Fred Hutch and UW Medicine / Miscellaneous Notes / MyChart DOC0008

Formatting of this note might be different from the original.
Discussed plan with Dr. Symonds who plans to reach out to patient to discuss imaging. In the interim, MD suggests referral to specialist (neuro) for review. RN placed call to Mark to let him know this. Left message, asked for return call.

ADDENDUM:
Mark returned call. He states that he spoke with Dr. Som who reviewed the findings with Mark and the patient and Mark has no further questions at this time. Pt plans to come to follow up visit as scheduled on 11/20

Medication Administrations This Visit
fluorodeoxyglucose (F-18) FDG radio-isotope injection 10 millicurie | Admin Date
11/16/2026 10:21 | Action
Contrast Given | Dose
10.11 millicurie | Route
Intravenous | Site

Documented By
Sabunciyan, Saro, RT

Ordering Provider: Symonds, Lynn Katherine, MD

Initial Dose: 10.11 mCi Time:10:21
Injection Time: Time:10:21
Residual dose and time:0.001 mCi Time:10:29
Administered dose: 10.11 mCi

Injection location: left AC
Uptake time: 60 min
FDG Only:

Glucose, POCT (mg/dL)

Date Value

11/16/2026 94

Other General Notes:
Vaccination status (specialty doses)
If patient is pregnant or breastfeeding

Answer Comment

Have you had a prior PET scan? Yes

Have you done any vigorous exercise in the last 24 hours? No

Have you been fasting for at least 6 hours? Yes

Are you diabetic? No

What type of diabetic medication do you take?

When are your diabetic meds taken?

Have you received any bone marrow stimulating injections in the last two weeks (Neupogen, Neulasta, Procrit, or G-shot)? No

Please give name of the bone marrow stimulating drug that was administered.

What date was the bone marrow stimulating drug administered?

Have you had any recent flus or infections? No

Are you claustrophobic? No

Have you had any reactions to iodinated CT contrast? No

Have you had any vaccinations in the last six weeks? No

What date was the recent vaccine administered?

What arm was your recent vaccine administered?

Have you ever taken semaglutide medications (Ozempic, Mounjaro, Rybelsus, Wegovy)? No

How long ago was your last dosage?

Are you currently pregnant? No

Are you currently breastfeeding? No

Medications

Medication / Sig / Dispense Quantity / Last Filled / Start Date / End Date / Status

Medication propranolol 10 MG tablet
Sig Take 1 tablet by mouth daily.
Status Active

Medication naloxone 4 MG/0.1ML nasal spray
Sig Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
Dispense Quantity 2 each
Start Date 07/27/2026
End Date 07/27/2027
Status Active

Medication albuterol HFA 108 (90 Base) MCG/ACT inhaler
Sig Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing.
Status Active

Medication tretinoin 0.025 % cream
Sig Apply 1 application topically 3 times a week. Apply to face.
Status Active

Medication cholecalciferol 50 mcg (2,000 unit) capsule
Sig Take 2 capsules by mouth daily.
Status Active

Medication polyethylene glycol 3350 17 g packet
Sig Take 1 packet by mouth daily. Dissolve in 4-8 ounce water.
Status Active

Medication acetaminophen 325 MG tablet
Sig Take 3 tablets by mouth every 8 hours.
Start Date 07/30/2026
Status Active

Medication lidocaine viscous 2 % mouth/throat solution
Sig Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply

to back of throat).
Dispense Quantity 200 mL
Start Date 08/06/2026
Status Active

Medication pantoprazole 40 MG EC tablet
Sig Take 1 tablet by mouth daily on an empty stomach.
Dispense Quantity 20 tablet
Start Date 08/06/2026
Status Active

Medication anastrozole 1 MG tablet
Sig Take 1 tablet by mouth daily.
Dispense Quantity 30 tablet
Start Date 08/21/2026
Status Active

Medication ondansetron 8 MG tablet
Sig Take 1 tablet by mouth every 8 hours.
Status Active

Medication senna 8.6 MG tablet
Sig Take 2 tablets by mouth at bedtime as needed for constipation.
Dispense Quantity 60 tablet
Start Date 10/06/2026
Status Active

Medication prochlorperazine 10 MG tablet
Sig Take 1 tablet by mouth every 6 hours as needed.
Start Date 07/24/2026
Status Active

Medication Lidocaine 10 % cream
Sig Apply 1 g topically.
Start Date 07/13/2026
Status Active

Medication cyclobenzaprine 10 MG tablet
Sig TAKE 1/2 TO 1 TABLET BY MOUTH THREE TIMES DAILY AS NEEDED FOR MUSCLE SPASMS
Start Date 04/24/2026
Status Active

Medication citalopram 20 MG tablet
Sig Take 1 tablet by mouth daily.
Start Date 08/05/2026
Status Active

Medication meloxicam 15 MG tablet
Start Date 05/12/2026
Status Active

Medication oxyCODONE 10 MG tablet
Sig Take 1 tablet by mouth every 3 hours as needed for moderate pain.
Dispense Quantity 100 tablet
Start Date 11/04/2026
End Date 12/04/2026
Status Active

Medication morphine ER 15 MG ER tablet
Sig Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours
Dispense Quantity 90 tablet

Start Date 11/04/2026
End Date 12/04/2026
Status Active

Medication morphine ER 30 MG ER tablet
Sig Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours
Dispense Quantity 90 tablet
Start Date 11/04/2026
End Date 12/04/2026
Status Active

Medication ribociclib (400 mg dose) 200 MG tablet therapy pack
Sig Take 2 tablets by mouth daily. Take daily on days 1-21 followed by 7 days off of each 28-day cycle.
Dispense Quantity 42 tablet
Start Date 11/06/2026
Status Active

Medication ribociclib (600 mg dose) 200 MG tablet therapy pack
Sig Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days.
Dispense Quantity 63 tablet
Start Date 09/12/2026
End Date 11/06/2026
Status Discontinued (Side effects/adverse reaction)

Medication oxyCODONE 10 MG tablet
Sig Take 1 tablet by mouth every 3 hours as needed for moderate pain.
Dispense Quantity 100 tablet
Start Date 09/23/2026
End Date 10/26/2026
Status Discontinued (Reorder)

Medication morphine ER 30 MG ER tablet
Sig Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours
Dispense Quantity 90 tablet
Start Date 10/06/2026
End Date 11/04/2026
Status Discontinued (Reorder)

Results

• CT Mid-Spine with Contrast (CT T SPINE W CONTRAST) - Final result (11/16/2026 1:07 PM PST)

Anatomical Region Laterality Modality

T-spine N/A Positron Emission Tomography (PET)

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

11/18/2026 2:53 PM PST

Impressions

11/18/2026 3:34 PM PST

1. Slight interval progression and height loss of the pathologic compression deformity of C4 noted possibly 40% height loss without osseous retropulsion.
2. Slightly increased sclerotic appearance of numerous multifocal osseous lesions which likely represents posterior mass effect.

This is a preliminary report dictated by Thaddeus Wright, M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

11/18/2026 3:34 PM PST

This result has an attachment that is not available.

EXAMINATION:
CT C SPINE W CONTRAST, CT T SPINE W CONTRAST

CLINICAL INDICATION:
interval scan for known cervical lesion

TECHNIQUE:
CT Cervical Spine with contrast: routine (N-54)
Contiguous axial sections were obtained through the cervical spine from [the occiput] through [T3] following intravenous contrast. Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.
(accession 61124554), CT Thoracic Spine with contrast: Routine (N-60)
Contiguous axial sections were obtained from [C7] through [L1] following intravenous contrast Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure. exposure.
(accession 61124518)

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,40 mL Intravenous,11/16/2026 1302 (accession 61124554), IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,11/16/2026 1307 (accession 61124518)

Inferior Extent: L2

COMPARISON:
CT 7/27/2026, MRI 11/8/2026

FINDINGS:
CERVICAL SPINE:

ALIGNMENT: Straightening of the normal cervical lordosis.
VERTEBRAE: Pathologic compression deformity of C4 with approximately 40% height loss and no osseous retropulsion secondary to the lytic lesion involving nearly the entirety of the vertebral body. Similar height loss of T1 at the known additional pathologic depression fracture with approximately 25% height loss without osseous retropulsion. Otherwise overall similar size and number and distribution of numerous additional diffuse osseous

metastatic lesions.
HARDWARE: No hardware present.
CORD: Visualized cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal.

LEVELS: No central or foraminal stenosis, facets are normal unless described separately below.
ABNORMAL LEVELS: None.

THORACIC SPINE:
ALIGNMENT: Focal kyphosis at T8 secondary to the pathologic compression deformity.
VERTEBRAE: Post kyphoplasty and pathologic compression fracture of T8 with approximately 50% height loss without osseous retropulsion. Slightly increased sclerosis of some of the known diffuse lytic lesions throughout the spine which may reflect treatment response. Similar additional multiple level compression deformities of T4 and T5. No new fractures.
HARDWARE: No hardware present.
SAGITTAL DISKS: Mild multilevel degenerative changes with slight height loss and endplate spurring.
CORD: Visualized throracic cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal. A CT chest is reported separately.

TECHNIQUE:
CT Cervical Spine with contrast: routine (N-54)
Contiguous axial sections were obtained through the cervical spine from [the occiput] through [T3] following intravenous contrast. Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.
(accession 61124554), CT Thoracic Spine with contrast: Routine (N-60)
Contiguous axial sections were obtained from [C7] through [L1] following intravenous contrast Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure. exposure.
(accession 61124518)

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,40 mL Intravenous,11/16/2026 1302 (accession 61124554), IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,11/16/2026 1307 (accession 61124518)

Inferior Extent: L2

COMPARISON:
CT 7/27/2026, MRI 11/8/2026

FINDINGS:
CERVICAL SPINE:

ALIGNMENT: Straightening of the normal cervical lordosis.
VERTEBRAE: Pathologic compression deformity of C4 with approximately 40% height loss and no osseous retropulsion secondary to the lytic lesion involving nearly the entirety of the vertebral body. Similar height loss of T1 at the known additional pathologic depression fracture with approximately 25% height loss without osseous retropulsion. Otherwise overall similar size and number and distribution of numerous additional diffuse osseous metastatic lesions.
HARDWARE: No hardware present.
CORD: Visualized cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal.

LEVELS: No central or foraminal stenosis, facets are normal unless described separately below.
ABNORMAL LEVELS: None.

THORACIC SPINE:
ALIGNMENT: Focal kyphosis at T8 secondary to the pathologic compression deformity.
VERTEBRAE: Post kyphoplasty and pathologic compression fracture of T8 with approximately 50% height loss

without osseous retropulsion. Slightly increased sclerosis of some of the known diffuse lytic lesions throughout the spine which may reflect treatment response. Similar additional multiple level compression deformities of T4 and T5. No new fractures.
HARDWARE: No hardware present.
SAGITTAL DISKS: Mild multilevel degenerative changes with slight height loss and endplate spurring.
CORD: Visualized throracic cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal. A CT chest is reported separately.

IMPRESSION
1. Slight interval progression and height loss of the pathologic compression deformity of C4 noted possibly 40% height loss without osseous retropulsion.
2. Slightly increased sclerotic appearance of numerous multifocal osseous lesions which likely represents posterior mass effect.

This is a preliminary report dictated by Thaddeus Wright, M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

I have personally reviewed the images and agree with the report (or as edited).

EXAMINATION:
PET CT MID BODY

CLINICAL INDICATION:
restaging.

Imaging requested for restaging.

Subsequent treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,10.11 millicurie Intravenous,11/16/2026 1224
Injection site: Left antecubital fossa

TECHNIQUE:
Extent: Skull vertex to toes.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 94 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold CT images were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
PET/MR July 21, 2026, MRI CTL spine November 8, 2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.3
Mediastinal blood pool maximum SUV: 1.4
Liver mean SUV: 2.1.

Head and neck:
Unremarkable.

Chest:
* Similar mild uptake involving the left upper outer breast with SUV max 2.0 (12/167), previously SUV max 1.9.
* Previously seen hypermetabolic right axillary lymph node is less conspicuous.

Abdomen and Pelvis:
Unremarkable.

Osseous structures:
The previously seen numerous foci of FDG uptake throughout the axial and appendicular skeleton are markedly decreased, with few areas of residual uptake, for example:
* Decreased uptake at the left posterior ninth rib pathologic fracture with underlying lesion with SUV max 1.6 (12/206), previously SUV max 3 5.
* Decreased uptake at left proximal femur lytic lesion with SUV max 4.2 (12/401), previously SUV max 5.4.
* Similar uptake in the right femoral neck lytic lesion with SUV max 6.8 (12/392), previously SUV max 6.5.
* Decreased uptake in the right L5 vertebral body lytic lesion with SUV max 2.1 (12/305), previously with SUV max 5.4.

Extremities:
Unremarkable.

Additional noncontrast CT findings:
Please see separately dictated report for same-day contrast CT. No additional findings are identified on the non-contrast CT performed for attenuation correction.

Avik Som IMG MRI PROCEDURES Final Result

• MRI L SPINE WO/W CONTRAST - Final result (11/08/2026 1:05 PM PST)

Anatomical Region Laterality Modality

L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

11/12/2026 8:28 AM PST

Impressions

11/12/2026 9:46 AM PST

Compared to MRI of lumbar spine September 24, 2026:

1. Multifocal osseous metastatic disease involving the lumbar spine, sacrum, and iliac bones, overall similar in distribution with decreased enhancement of several lesions. Unchanged pathologic compression deformity of L5.
2. Mild nonspecific enhancement of the L1 nerve roots, concerning for leptomeningeal disease.
3. Limited evaluation of the sacrum, though within this limitations, similar epidural extension at S1-S3 with mild thecal sac indentation.

The following findings are so common in normal, pain-free volunteers that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years who do not have back pain, an MRI will find that about:
* 8 in 10 have disk degeneration
* 7 in 10 have disk signal loss (desiccation)
* 6 in 10 have disk height loss
* 6 in 10 have a bulging disk
* 3 in 10 have an annular fissure
* 3 in 10 have a disk protrusion

Note that even 3 in 10 means that the finding is quite common in people without back pain.
(AJNR 2015; 6:811-6)j

FINAL REPORT: Agree with above. Mild epidural enhancement at mid L2, mid L4, mid L5 is also unchanged from the earlier study

I have personally reviewed the images and agree with the report (or as edited).

EXAMINATION:
MRI L SPINE WO/W CONTRAST

CLINICAL INDICATION:
Persistent symptoms

ADDITIONAL HISTORY:
Intermittent electric tingling down the posterior legs with neck flexion or extension
Metastatic breast cancer involving the T-spine with associated compression fractures; concern for progression

TECHNIQUE:
MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase
Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,5.5 mmol Intravenous,11/08/2026 1305

COMPARISON:
Lumbar spine MRI dated September 24, 2026

FINDINGS:
ALIGNMENT: Mild retrolisthesis of L4 on L5 (grade 1). Mildly decreased normal lumbar lordosis, likely positional.
MARROW:

- Heterogenous appearance of lumbar spine marrow with multiple ill-defined osseous metastatic lesions, which overall appear to be similar in distribution, with interval decrease in the extent of enhancement and some of the lesions. Index lesions includes:
-Lesion in the anterior aspect of the L3 vertebral body, measuring 0.8 x 1.4 cm (1901/54)
-Lesion in the anterior aspect of the L5 vertebral body, measuring 0.7 x 2.0 cm (1901/41)
-Lesion in the right L4 lamina, measuring 1.0 x 1.3 cm (1801/15, 1901/44)
-Partially visualized multiple lesions in the sacrum and bilateral iliac bones (1601/3)
- Similar pathologic compression deformity of the right aspect of the L5 vertebral body.

DISCS: Moderate L2-L3 and mild L5-S1 disc desiccation and disc height loss.
CORD: Mildly enhancing nerve roots of the level of L1 (1901/64). Conus ends normally at L2. Lumbar cord and cauda equina are normal.
PARAVERTEBRAL SOFT TISSUES: Unremarkable.
ENHANCEMENT: Similar extraosseous extension of the enhancing lesions, including:
- Similar epidural extension of the disease at the levels of S1, with mild indentation of the thecal sac (1801/9)
- Similar epidural extension of the disease at the level of S2 and S3, with mild indentation of the thecal sac (1501/10, 15 0 1/11)

11/10/2026 11:04 PM PST

Impressions

11/10/2026 11:33 PM PST

1. Areas of enhancement within the cervical vertebrae have decreased overall since July 2026. This is consistent with therapeutic response.
2. New mild height loss of the C4 vertebral body since July 2026. This is consistent with a mild pathologic fracture. However, no significant narrowing of the spinal canal is identified at this level.
3. No evidence of intradural metastases are seen in the cervical spine. No cervical spinal cord abnormality identified.
4. Questionable mild size increase of bilateral cervical lymph nodes since July 2026. Consider a dedicated CT neck for further evaluation.

July 27, 2026.

FINDINGS:
ALIGNMENT: Mild reversal of the normal cervical lordosis is again seen. Mild retrolisthesis at C5-6 is unchanged.
MARROW: Heterogeneous marrow signal again seen in the cervical vertebrae. However, the areas of enhancement in the cervical spine have decreased overall since July 2026.

Mild height loss of the C4 vertebral body is new since July 2026. However, mild height loss of the C6 vertebral body is similar. No retropulsion of fracture fragments is identified.
DISCS: Discs are similar in height and signal intensity to the prior exam.
CORD: Visualized spinal cord is normal in signal and size. No abnormal cord or intradural enhancement.
PARAVERTEBRAL SOFT TISSUES: Small bilateral cervical lymph nodes. Questionable mild size increase since July 2026. However, these would be better assessed on a dedicated CT neck.

AXIAL DISCS, DURAL COMPRESSION & FORAMINA:
C2-3: No central or foraminal stenosis. Facets are normal.
C3-4: No foraminal stenosis. Mild central stenosis. Unchanged from July 2026.
C4-5: No foraminal stenosis. Mild central stenosis. Unchanged.
C5-6: No foraminal stenosis. Mild central stenosis. Unchanged.
C6-7: No foraminal stenosis. Mild central stenosis. Unchanged.
C7-T1: No central or foraminal stenosis.

• XR T SPINE 2 VW - Final result (10/30/2026 1:44 PM PDT)

Anatomical Region Laterality Modality

T-spine N/A Digital Radiography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

10/31/2026 12:54 AM PDT

Impressions

10/31/2026 1:10 AM PDT

Thoracic spine:

Compared with the August 28, 2026 CT, there appears to be relatively stable appearance of the T1 and T4 mild compression fractures but apparent progression of the T5 anterior wedging with height loss of approximately 55% compared with prior approximately 40%. There is also slight increased focal kyphosis with Cobb angle of approximately 21 degrees between bottom of T4 and top of T6 on the standing x-rays versus approximately 7 degrees on the supine CT.

There appears to be questionable minor progression of the T8 vertebral anterior wedge compression fracture status post vertebroplasty with approximately 60% anterior height loss versus approximately 50% on the September 16, 2026 procedure x-rays appears relatively similar focal kyphosis measuring degrees between bottom of T7 and top of T9.

The thoracic vertebral bodies are otherwise intact and in anatomic alignment on the lateral view. There is minimal right convex scoliosis centered at approximately T5/6.. There are mild degenerative disc changes in the mid and lower thoracic spine. Multiple lytic and blastic bony lesions are better seen on prior CT and MR grossly stable. A paper clip is noted along the back which is centered at the approximate T8/9 level presumably indicating level of pain.

Lumbar spine:

The lumbar vertebral bodies are intact and in similar alignment on the lateral view again with mild retrolisthesis at L5/S1 and minimal retrolisthesis at L4/5.. There are mild to moderate degenerative disc changes at L5/S1 with disc height loss, osteophytes, and facet sclerosis. There are mild degenerative changes at L2/3 and L4/5. Patient is status post vertebroplasty at S1 which appears relatively stable. Lytic and blastic lesions are grossly stable but better seen on prior CT and MRI. No new fractures or subluxations. The paperclip present along the surface of the lower back centered at the L5/S1 level.

• Carcinoembryonic Antigen (CARCINOEMBRYONIC ANTIGEN) - Final result (10/23/2026 7:27 AM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Carcinoembryonic Antigen (Beckman) 4.4 0.0 - 5.0 ng/mL 10/23/2026 9:07 AM PDT FHCC Clinical Laboratories

Comment:

This result was generated by the Beckman Access 2 automated immunoassay analyzer in the Fred Hutchinson Cancer Center laboratory. Significant change in lab result, rechecked by lab.

Carcinoembryonic Antigen (Roche) 3.7 0.0 - 3.7 ng/mL 10/23/2026 8:03 AM PDT FHCC Clinical Laboratories

Comment:
For healthy smokers: results are expected to be <5.5 ng/mL By the Roche Cobas e801 Immunoassay Analyzer

• Brain MRI (MRI BRAIN TUMOR/METASTASIS) - Final result (09/24/2026 7:21 PM PDT)

Anatomical Region Laterality Modality

Brain N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

09/25/2026 12:03 AM PDT

Impressions

09/25/2026 12:13 AM PDT

1. Essentially negative brain MRI without evidence of metastases or cause of headaches identified.

Narrative

09/25/2026 12:13 AM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI BRAIN TUMOR/METASTASIS

CLINICAL INDICATION:
breast cancer, HA , eval for CNS mets
Secondary malignant neoplasm of bone

TECHNIQUE:
MRI Head without and with contrast: Tumor (Primary) (B 2PT)
Non-contrast: Axial T1, T2, DWI, Post-contrast : Sagittal 3D FLAIR. Sagittal, axial and coronal T1

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,11 mL Intravenous,09/24/2026 1921

COMPARISON:
Head CT August 16, 2026 and head CT/CTA July 27, 2026..

FINDINGS:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: There are several tiny periventricular and deep white matter foci of high FLAIR signal. These are nonspecific but most commonly incidental and related to age related microvascular changes. The brain parenchyma is otherwise unremarkable. No hemorrhage or mass lesion is seen .
ENHANCEMENT: There is a tiny 1 to 2 mm focus of enhancement along the left precentral gyrus visible on the turbo spin-echo axial images (series 1601, image 143) but not identified on the SPGR postcontrast or FLAIR images and appears somewhat linear on the sagittal turbo spin-echo reconstructions (series 1603, image 73)

and most likely represents an incidental prominent vein however attention this region may be helpful on future scans. There is no correlating enhancement or apparent vessel on the July 27, 2026 CTA.
VASCULAR: Cavernous carotid, vertebral, and other intracranial vascular flow voids are normal
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear with incidentally noted minor right maxillary sinus small mucous retention cysts.. Orbits are normal.

Amy N West IMG MRI PROCEDURES Final Result

• MRI L SPINE WO/W CONTRAST - Final result (09/24/2026 7:21 PM PDT)

Anatomical Region Laterality Modality

L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

09/25/2026 4:59 PM PDT

Impressions

09/25/2026 9:22 PM PDT

In comparison to MRI lumbosacral spine 7/27/2026:
1. Accounting for differences in technique, similar appearance and extent of multilevel diffuse enhancing osseous metastasis with epidural extension as detailed above.
2. Most notably, expansile soft tissue within S2 and S3 with ventral epidural extension and mild deformation of the ventral thecal sac, as well as extension into the right S2 neuroforamina.
3. Slightly improved encasement of the right S2 nerve root at the level of the foramina.

The following findings are so common in normal, pain-free volunteers that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years who do not have back pain, an MRI will find that about:
* 8 in 10 have disk degeneration
* 7 in 10 have disk signal loss (desiccation)
* 6 in 10 have disk height loss
* 6 in 10 have a bulging disk
* 3 in 10 have an annular fissure
* 3 in 10 have a disk protrusion
Note that even 3 in 10 means that the finding is quite common in people without back pain.
(AJNR 2015; 6:811-6)

ATTENDING FINAL REVIEW:

I agree with the preliminary report.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

09/25/2026 9:22 PM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI L SPINE WO/W CONTRAST

CLINICAL INDICATION:
metastatic Lt breast cancer (ER+/PR+/Her2-) diffusely to bone with lesions along the entire spinal axis with

diffuse T-spine pain s/p 8 Gy x1 to C4-T11, kyphoplasty to T8 and S1 on 9/16, SBRT planning, also with new sacrum pain

TECHNIQUE:
MRI Lumbar Spine without and with contrast for radiation treatment planning. FOV centered at treatment level.
Pre Contrast: 2D T1, 3D T1, 3D T2, Cardiac Triggered BFFE, DTI
Post Contrast: DCE T1, 3D T1 Fat Sat

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,11 mL Intravenous,09/24/2026 1921

COMPARISON:
MRI lumbosacral spine 7/27/2026

FINDINGS:
ALIGNMENT: Normal
MARROW: Diffuse T1 hypointense, enhancing osseous metastasis. Redemonstrated pathologic compression deformity of the right aspect of the L5 vertebral body. The vertebral body heights are otherwise well-maintained.
DISCS: Mild multilevel disc height loss and disc desiccation.
CORD: Conus ends at L2. Visualized cord and cauda equina are normal.
PARAVERTEBRAL SOFT TISSUES: Normal
ENHANCEMENT: Extraosseous extension of enhancing tumor as detailed below:
* Similar ventral epidural extension at L2, L3, and L5 (right aspect) without deformation of the thecal sac.
* Similar ventral epidural extension at S1 with mild indentation of the ventral thecal sac.
* Similar expansile enhancing soft tissue within S2 and S3 with ventral epidural extension and mild indentation of the ventral thecal sac, as well as extension into the right S2 neuroforamina. Slightly improved encasement of the right S2 nerve root at the level of the foramina.

AXIAL DISCS, DURAL COMPRESSION & FORAMINA: As above. Otherwise, no high-grade central canal or foraminal stenosis.

T8 and S1 unipedicular kyphoplasty and ablation.
S1 biopsy

PLAN:Follow-up in clinic in one month.

Narrative

09/16/2026 6:10 PM PDT

This result has an attachment that is not available.

PROCEDURE:
NIR ANGIO VERTEBROPLASTY, kyphoplasty and ablation of T8 and S1. Biopsy of S1

PRE-PROCEDURE DIAGNOSIS:
Metastatic breast cancer

POST-PROCEDURE DIAGNOSIS:
Same.

CONSENT:
The risks, benefits, and alternatives of the planned procedure were explained in detail to the patient. Questions were answered and written informed consent was obtained.

TIME OUT:
A time out and final verification was done by the entire team to verify patient, procedure, and site.

STERILE PREPARATION:
All elements of maximal sterile barrier technique were followed, including use of cap, mask, sterile gown, gloves, sterile sheet, chlorhexidine 2% isopropyl alcohol or povidone-iodine, and appropriate hand hygiene.

ANESTHESIA/SEDATION:
Anesthesia supervision: Dirrect monitoring by Interventional Radiology physician performing procedure, and administered by appropriately credentialed nurse.

Level of anesthesia achieved: Moderate sedation: Nurse or other qualified health professional providing continuous monitoring of sedation and vital signs throughout the procedure

DESCRIPTION OF PROCEDURE AND FINDINGS:
Procedure:
The patient was brought to the angiography suite and placed prone upon the examination table. The patient was

prepped and draped in the usual sterile fashion. The T7 vertebral levels were identified and targeted using fluoroscopy. The soft tissues above the unilateral T8 and S1 pedicles were anesthetized using lidocaine via a 25G needle and subsequently a 22G spinal needle. With a unipedicular transpedicular approach, separate 11G needles were placed into the lateral aspect of the T8 and S1 vertebral bodies under fluoroscopic guidance with position confirmed under lateral and frontal projections. S1 was repeatedly assessed with repeat cone beam CTs. Biopsy of S1 was performed through the left transpedicular approach.

Subsequent evaluation demonstrated adjustable radiofrequency probe placed through the left T8 and S1 pedicle and curved medially and superiorly. Additionally, radiofrequency probes were placed through T8 and S1 pedicles and curved superomedially and inferomedially. Radiofrequency ablation was then performed to the appropriate and targeted the 50 degrees Celsius. Radiofrequency probes were then removed.

Methylmethacrylate was mixed and injected through both needles under direct fluoroscopic visualization. Subsequently, needles were removed. The patient tolerated the procedure well with no immediate complications.

T8 and S1 was done in sequence. T8 was done first, and then S1.

FINDINGS:

Initial evaluation delineated successful bilateral pedicular needle placement and subsequent fluoroscopic spot film demonstrated good needle tip positioning within the T8 and S1 vertebrae.

Subsequent evaluation then demonstrated ablation and augmentation as described above with final films demonstrating good vertebral fill and no significant extraosseous extension. There is a small amount of cement extravasation into the right S1 neural foramina that appears largely open on final cone beam CT. .

RADIATION DOSE:

Fluoroscopy time for this procedure was 25 minutes.

ESTIMATED BLOOD LOSS:

Minimal.

SPECIMENS OBTAINED:

None

COMPLICATIONS:

None.

Procedure Note

Avik Som - 09/16/2026

Formatting of this note might be different from the original.

PROCEDURE:

NIR ANGIO VERTEBROPLASTY, kyphoplasty and ablation of T8 and S1. Biopsy of S1

PRE-PROCEDURE DIAGNOSIS:

Metastatic breast cancer

POST-PROCEDURE DIAGNOSIS:

Same.

CONSENT:

The risks, benefits, and alternatives of the planned procedure were explained in detail to the patient. Questions were answered and written informed consent was obtained.

TIME OUT:

A time out and final verification was done by the entire team to verify patient, procedure, and site.

STERILE PREPARATION:

All elements of maximal sterile barrier technique were followed, including use of cap, mask, sterile gown, gloves, sterile sheet, chlorhexidine 2% isopropyl alcohol or povidone-iodine, and appropriate hand hygiene.

ANESTHESIA/SEDATION:
Anesthesia supervision: Dirrect monitoring by Interventional Radiology physician performing procedure, and administered by appropriately credentialed nurse.

Level of anesthesia achieved: Moderate sedation: Nurse or other qualified health professional providing continuous monitoring of sedation and vital signs throughout the procedure

DESCRIPTION OF PROCEDURE AND FINDINGS:
Procedure:
The patient was brought to the angiography suite and placed prone upon the examination table. The patient was prepped and draped in the usual sterile fashion. The T7 vertebral levels were identified and targeted using fluoroscopy. The soft tissues above the unilateral T8 and S1 pedicles were anesthetized using lidocaine via a 25G needle and subsequently a 22G spinal needle. With a unipedicular transpedicular approach, separate 11G needles were placed into the lateral aspect of the T8 and S1 vertebral bodies under fluoroscopic guidance with position confirmed under lateral and frontal projections. S1 was repeatedly assessed with repeat cone beam CTs. Biopsy of S1 was performed through the left transpedicular approach.

Subsequent evaluation demonstrated adjustable radiofrequency probe placed through the left T8 and S1 pedicle and curved medially and superiorly. Additionally, radiofrequency probes were placed through T8 and S1 pedicles and curved superomedially and inferomedially. Radiofrequency ablation was then performed to the appropriate and targeted the 50 degrees Celsius. Radiofrequency probes were then removed.

Methylmethacrylate was mixed and injected through both needles under direct fluoroscopic visualization.
Subsequently, needles were removed. The patient tolerated the procedure well with no immediate complications.

T8 and S1 was done in sequence. T8 was done first, and then S1.

FINDINGS:
Initial evaluation delineated successful bilateral pedicular needle placement and subsequent fluoroscopic spot film demonstrated good needle tip positioning within the T8 and S1 vertebrae.
Subsequent evaluation then demonstrated ablation and augmentation as described above with final films demonstrating good vertebral fill and no significant extraosseous extension. There is a small amount of cement extravasation into the right S1 neural foramina that appears largely open on final cone beam CT. .

RADIATION DOSE:
Fluoroscopy time for this procedure was 25 minutes.

ESTIMATED BLOOD LOSS:
Minimal.

SPECIMENS OBTAINED:
None

COMPLICATIONS:
None.

IMPRESSION
T8 and S1 unipedicular kyphoplasty and ablation.
S1 biopsy

PLAN:Follow-up in clinic in one month.

• PATHOLOGY, SURGICAL - Final result (09/16/2026 5:06 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Final Diagnosis A) Sacrum, biopsy:
- Cytokeratin-positive cells in a background of blood and bone marrow, consistent with metastatic carcinoma.
- See comment.

COMMENT:
The specimen contains blood clot and fragments of bone marrow with scattered cytokeratin AE1/AE3 positive cells, consistent with carcinoma and morphologically consistent with metastatic carcinoma of breast origin.

Anatomical Region Laterality Modality

T-spine, L-spine N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

08/29/2026 6:41 AM PDT

This result has an attachment that is not available.

PROCEDURE: CT scan of the thoracolumbar spine. August 28, 2026 0850 hours

Clinical History: Thoracic and lumbar metastasis. Evaluate for compression fractures. Please extend to include sacrum and pelvis.

Technique: Helical axial sections with sagittal and coronal reformats of the thoracolumbar spine were obtained with intravenous contrast. Iterative reconstruction technique was employed to reduce patient radiation exposure.

Radiation Dose: Total exam DLP 519 mGy/cm.

Comparison: Compared with the prior CT whole spine study dated July 27, 2026 and correlated with the prior MR spine study dated July 27, 2026

Findings:

Straightening of the thoraco-lumbar spine. Multifocal lytic lesions involving in vertebral bodies and posterior elements, unchanged since the prior study.

Again seen are compression fracture deformities of the T1, T4, T5 and T8 vertebral bodies with a mild reduction in the vertebral body heights, similar to the prior CT and MRI study. Again seen is extraosseous soft tissue extension of the right transverse process lytic lesion resulting in right T8/T9 neural foraminal narrowing, also unchanged since the prior study.

There is a similar dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 2.6 x 1.6 cm in axial dimensions (image 798, series 304). The lesion compresses anterior thecal sac.

Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal, unchanged.

Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles, unchanged.

Impression:

Multifocal lytic lesions involving the axial and appendicular skeleton with compression fracture deformities of the thoracic vertebrae and similar dominant soft tissue component surrounding the S1, S2/S3 lytic lesions causing canal compromise as detailed above.

Date of Order: 8/28/2026 1:06:00 PM

Formatting of this note might be different from the original.

PROCEDURE: CT scan of the thoracolumbar spine. August 28, 2026 0850 hours

Clinical History: Thoracic and lumbar metastasis. Evaluate for compression fractures. Please extend to include sacrum and pelvis.

Technique: Helical axial sections with sagittal and coronal reformats of the thoracolumbar spine were obtained with intravenous contrast. Iterative reconstruction technique was employed to reduce patient radiation exposure.

Radiation Dose: Total exam DLP 519 mGy/cm.

Comparison: Compared with the prior CT whole spine study dated July 27, 2026 and correlated with the prior MR spine study dated July 27, 2026

Findings:

Straightening of the thoraco-lumbar spine. Multifocal lytic lesions involving in vertebral bodies and posterior elements, unchanged since the prior study.

Again seen are compression fracture deformities of the T1, T4, T5 and T8 vertebral bodies with a mild reduction in the vertebral body heights, similar to the prior CT and MRI study. Again seen is extraosseous soft tissue extension of the right transverse process lytic lesion resulting in right T8/T9 neural foraminal narrowing, also unchanged since the prior study.

There is a similar dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 2.6 x 1.6 cm in axial dimensions (image 798, series 304). The lesion compresses anterior thecal sac.

Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal, unchanged.

Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles, unchanged.

Impression:

Multifocal lytic lesions involving the axial and appendicular skeleton with compression fracture deformities of the thoracic vertebrae and similar dominant soft tissue component surrounding the S1, S2/S3 lytic lesions causing canal compromise as detailed above.

• CT SCAN HEAD W/O CONTRAST (CT HEAD W/O CONTRAST) - Final result (08/16/2026 7:39 PM PDT)

Anatomical Region Laterality Modality

Head N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

08/16/2026 8:08 PM PDT

Impressions

08/16/2026 9:14 PM PDT

1. No acute intracranial abnormality.

This is an afterhours preliminary report generated by Sina Hosseinian, PGY-3. Unless an attending attestation appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW

I agree with the preliminary report with the following comment:

Osseous lytic lesion in the left mandibular condyle with cortical breakthrough posteriorly (302/9, 10).

I have personally reviewed the images and agree with the report (or as edited).

Narrative

08/16/2026 9:14 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT HEAD W/O CONTRAST

CLINICAL INDICATION:
headache, hx breast cancer

TECHNIQUE:
5 mm MDCT images from skull base to vertex without contrast. Patient age specific parameters were used for radiation exposure.

COMPARISON:
CT head 7/27/2026

FINDINGS:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.

VASCULAR: Cavernous carotids and vertebral vessels are normal.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Right maxillary sinus mucous retention cyst, otherwise the sinuses and mastoids are clear. Orbits are normal.

Procedure Note

• CTA Chest PE With Contrast (CTA CHEST PE W CONTRAST) - Final result (08/12/2026 3:50 PM PDT)

Anatomical Region Laterality Modality

Chest Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

08/12/2026 4:04 PM PDT

Impressions

08/12/2026 6:06 PM PDT

1. No evidence of acute pulmonary embolism.
2. Multiple lytic lesions as above, which have increased compared to prior. There are multiple new/worsening pathologic compression fractures involving the multiple thoracic vertebral bodies as above. Mild retropulsion of the T5 and T8 vertebral body fractures.
3. Multiple lytic rib lesions many of which involve the cortex. Increase in size of soft tissue component of the left 9th lytic rib lesion. New subacute fracture of the left 7th rib.
4. Left greater than right small lower lobe consolidations, likely atelectasis. Superimposed aspiration can't be excluded.
5. Similar solid pulmonary nodules. No new or enlarging nodules. Consider follow-up per oncology protocol.

COMMUNICATION:
The above was communicated by telephone to Sutanthavibul, ARNP by Lee, MD at 8/12/2026 4:52 PM.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

08/12/2026 6:06 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CTA CHEST PE W CONTRAST: PULMONARY EMBOLISM PROTOCOL

CLINICAL INDICATION:
ACE: 47yoF breast ca with mets to bone, worsening bilateral rib pain L>R anterior and lateral sides. Conern for metastatic lesions vs. PE.

TECHNIQUE:
CTB C3 CTA Chest Suspected pulmonary embolus.
Contiguous axial sections were obtained through the chest with IV contrast. Multiplanar reformatted images were performed. Axial MIPs were generated on the CT scanner console. Automated exposure control and statistical iterative reconstruction techniques substantially lowered patient radiation dose.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,50 mL Intravenous,08/12/2026 1550

COMPARISON:
CT chest on 7/13/2026.

FINDINGS:
Pulmonary artery findings: No evidence of acute pulmonary embolism.
The RV/LV ratio is less than 1, indicating no right ventricular pressure overload.

Supraclavicular region: Unremarkable.
Mediastinum: Unremarkable.
Heart: Unremarkable.
Lungs: Left greater than right small lower lobe consolidations. Bronchial wall thickening an scattered mucous plugging. Similar solid pulmonary nodules, for example 4 mm in the left lower lobe (305/177). No new or enlarging pulmonary nodules.
Pleura: Unremarkable.

Chest wall: Unremarkable.
Upper abdomen: Limited pulmonary arterial phase views of the upper abdomen are unremarkable.
Bones:
* Multiple lytic lesions within the bilateral ribs, spine, and sternum, are probably increased when compared to prior.
* Multiple new and/or worsening pathological compression fractures involving the T1, T5, and T8 vertebral bodies (602/56). There is 2 mm of retropulsion of the T5 vertebral body (602/56) and minimal retropulsion of the T8 vertebral body.
* Increased fracture of the T12 vertebral body now involving more of the inferior endplate (602/54). New pathologic fracture of the T10 inferior endplate (602/55).
* Left 9th rib lytic lesion with soft tissue component measuring 3.0 x 1.8 cm (305/150) previously 2.7 x 1.6 cm. Multiple chronic pathologic rib fractures. New subacute fracture of the left 7th rib (305/131).
* Multiple lytic rib lesions involve the cortex, for example (304/133, 304/68, 304/86).

• XR T SPINE 3 VW - Final result (07/28/2026 2:27 PM PDT)

Anatomical Region Laterality Modality

T-spine N/A Digital Radiography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 4:06 PM PDT

Impressions

07/28/2026 4:14 PM PDT

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

Narrative

07/28/2026 4:14 PM PDT

This result has an attachment that is not available.

EXAMINATION:
XR T SPINE 3 VW

CLINICAL INDICATION:
Localize levels of pain in spine

COMPARISON:
July 27, 2026 thoracic spine MRI and CT..

- MRI C T L SPINE WO/W CONTRAST (MRI C-T-L SPINE WO/W CONTRAST) - Final result (07/27/2026 11:57 PM PDT)

Anatomical Region Laterality Modality

C-spine, T-spine, L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 1:12 AM PDT

Impressions

07/28/2026 1:42 AM PDT

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
   Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/28/2026 1:42 AM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI C-T-L SPINE WO/W CONTRAST

CLINICAL INDICATION: Stage IV breast cancer.
metastatic cancer, lytic lesions in spine, spinal stenosis

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,6 mmol Intravenous,07/27/2026 2357

COMPARISON:
CT 7/27/2026.

FINDINGS:

SPINAL CORD: The conus medullaris terminates at the level of L1-L2, was in normal limits. There is no abnormal cord signal or abnormal cord enhancement.

SPINE: Mild apparent straightening of the normal cervical lordosis could be positional. The normal thoracic kyphosis is maintained. There is mild apparent straightening of the normal lumbar lordosis. Small central disc protrusions are seen at C3-C4, C5-C6 and C6-C7 as well as L2-L3 and L3-L4 resulting in impression of the ventral thecal sac. There is no significant canal or foraminal stenosis.

There is diffuse osseous metastasis in the cervical, thoracic, lumbar and sacral vertebral bodies as well as posterior elements.There are mild compression fractures involving T4, T5 (40% height loss) and T8 vertebral bodies. Possible fluid fluid level at T5 may represent hemorrhage within the vertebral body. L3 vertebral body demonstrates superior and inferior endplate Schmorl's nodules.

There is anterior epidural soft tissue extension at T5 (series 1301 image 10/17) and T8 (series 1601 image 18/62 without cord compression. There may also be possible epidural extension at T4.

Procedure Note

• CTA HEAD AND NECK ANGIO - Final result (07/27/2026 8:17 PM PDT)

Anatomical Region Laterality Modality

Brain N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/27/2026 9:18 PM PDT

Impressions

07/27/2026 9:48 PM PDT

1. Normal head CT. No acute infarct, hemorrhage or mass effect.
2. Normal CTA head. No high-grade stenosis or occlusion.
3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:
I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 9:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CTA HEAD AND NECK ANGIO

CLINICAL INDICATION:
metastatic cancer, pathologic neck fractures, NSGY requesting vascular imaging

TECHNIQUE:
CTA Head and Neck Stroke (N-48)
1. Non-contrast head: Contiguous axial sections were obtained through the head without contrast.
2. CTA Head/Neck: Contiguous axial sections were obtained from the aortic arch to the vertex during bolus infusion of contrast. Slab MIP reformatted images of extracranial and intracranial vessels were obtainedmultiple planes. 3. Post-contrast head: Contiguous axial sections were obtained through the head after contrast injection. Patient age specific scan parameters were used for radiation exposure.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,100 mL Intravenous,07/27/2026 2017

COMPARISON:
Same-day CT full spine.

FINDINGS:

NON-CONTRAST HEAD CT:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Cavernous carotids and vertebral vessels are normal.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear. Bilateral lens placements. Dental hardware..

POST-CONTRAST HEAD CT:
ENHANCEMENT: Normal intracranial enhancement.

HEAD CTA:
ARTERIES: Normal intracranial arteries. No aneurysm, AVM, stenosis or occlusion.

VARIANTS: Fetal origin of the left posterior cerebral artery. The right posterior communicating artery is diminutive..
VEINS: Dural sinuses and deep venous structures are normal.

NECK CTA:
AORTIC ARCH: Aortic arch and great vessel origins are unremarkable, bovine arch.
CAROTIDS: Common carotid vessels are normal. Internal carotid artery origins show no stenosis. Cervical ICA's are normal.
VERTEBRALS: Vertebral artery origins are normal. Cervical vertebral segments are normal.

Diffuse osseous lesions of the spine are described on same-day CT full spine.

Procedure Note

Chenara Johnson - 07/27/2026
Formatting of this note might be different from the original.

• CT Full Spine with Contrast (CT FULL SPINE W CONTRAST) - Final result (07/27/2026 3:00 PM PDT)

Anatomical Region Laterality Modality

Spine N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/27/2026 3:46 PM PDT

Impressions

07/27/2026 5:18 PM PDT

* Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR.
  * No definite new evidence of significant vertebral fracture or subluxation.
  * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.
  * Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 5:18 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT FULL SPINE W CONTRAST

CLINICAL INDICATION:
ACE patient - newly dx metastatic breast cancer. Acute on chronic bilateral cervical pain and left sided thoracic/lumbar pain.

COMPARISON: PET/MR on 07/21/2026; Spinal MRI on 07/01/2026

TECHNIQUE:
Contiguous axial sections were obtained through the cervical, thoracic, and lumbar spine from the occiput through sacrum with contrast.? Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.?

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/27/2026 1500

FINDINGS:

CERVICAL SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the C4 lesion involving the left pedicle. Mild height loss of C4 and C6 vertebrae.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES: No appreciable epidural soft tissue mass in this CT exam. Some extra-osseous soft tissue extension of the left C4 and C6 lateral transverse process lytic lesions, resulting in left foraminal canal narrowing.

THORACIC AND LUMBAR SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the T8 lesion involving the right pedicle. Mild compression fractures (<25%), for example T1, T4, T5, and T8 levels, grossly similar to 07/01/2026 thoracic spine MRI.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES:
* Some extra-osseous soft tissue extension of the right T8 transverse process lytic lesions, resulting in right T8/9 foraminal canal narrowing.
* One dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 29 x 34 mm in axial dimensions (304/686). The lesion compresses anterior thecal sac. Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal.

EXTRA-SPINAL FINDINGS:
Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles. Otherwise, no acute findings identified. Please refer to the recent PET/MRI for extraspinal disease.

Impressions

07/24/2026 12:48 PM PDT

Technically successful and uneventful CT guided core needle biopsy of the right iliac lesion.

PRESENCE STATEMENT:
I, Dr. Chankue Park, was present during the entire procedure. I have personally reviewed the images and agree with the report (or as edited).

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/24/2026 12:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT SUPERFICIAL BONE BX

CLINICAL INDICATION:
widespread bony mets, unkonwn primary, likely solid tumor.

PREPROCEDURE:
CT reveals lytic lesion over the right iliac bone.

TECHNIQUE:
Details of the procedure were discussed with the patient and written informed consent was obtained. Specifically, the risks, benefits, and alternatives of the procedure were discussed, including, but not limited to, bleeding, infection, pain, damage to adjacent structures, and nondiagnostic specimen. The patient was able to ask questions, indicated their understanding, and agreed to proceed.

A final time out was performed prior to commencing with the procedure.

SEDATION:
Incremental doses of intravenous midazolam and fentanyl was administered by the radiology nurse for moderate sedation with direct monitoring by the attending physician. Continuous hemodynamic and respiratory monitoring was performed throughout and following the procedure.

Duration of sedation: 60 minutes with 200 mcg fentanyl and 4mg versed. Please refer to sedation report for further details.

PROCEDURE:
The patient was directed into the supine. Skin over the right iliac was marked with CT guidance. The skin was then cleansed and draped. Adequate local anesthesia was achieved with subcutaneous 1% lidocaine. Under incremental CT guidance, a 14-gauge Bonopty coaxial penetrating needle was advanced through the cortex. An 18-gauge soft tissue biopsy needle was then advanced through the coaxial system into the right anterior iliac crest lytic lesion. 4 samples of 1-2 cm tan white tissue were obtained along with multiple fragmented tissues.

Needle was removed and hemostasis easily achieved. No immediate complications.

POSTPROCEDURE:
CT did not reveal any complications such as significant hemorrhage or pneumothorax.

Postprocedure orders were given to the patient and were documented in the patient's chart. Patient was sent to the floor with no discomfort or pain and in stable condition.

Specimen was sent to pathology department.

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 2 ADDENDUM REASON:
This addendum is issued to report the results of HER2 FISH testing performed. See Biomarker Summary template below. 08/13/2026 1:52 PM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY Addendum electronically signed by Dintzis, Suzanne Martha, MD on 8/13/2026 at 1352 PDT

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, and HER2 testing. See Biomarker Summary template below.

HER2 FISH studies have also been ordered and will be reported in a subsequent addendum.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

Protocol posted: 6/18/2025

Testing Performed on Specimen / Block Number(s): A1
Test(s) Performed:
HER2 by In Situ Hybridization (ISH) Status: Negative, based on IHC and ISH results
: Group 4 ISH result (with IHC 0-2+)
HER2 ISH Testing Signal Counts and Ratio:
Average Number of HER2 Signals per Cell: 4.35
Average Number of CEP17 Signals per Cell: 3.39
HER2 / CEP17 Ratio: 1.28
Comment(s) on HER2 ISH Results: This sample has a Group 4 result (ratio less than 2.0; greater than or equal to 4.0 and less than 6.0 HER2 signals / cell). It is uncertain whether patients with greater than or equal to 4.0 and less than 6.0 average HER2 signals / cell and HER2 / CEP17 ratio less than 2.0 benefit from HER2 targeted

therapy in the absence of protein overexpression (IHC 3+). If the specimen test result is close to the ISH ratio threshold for positive, there is a high likelihood that repeat testing will result in different results by chance alone. Therefore, when IHC results are not 3+ positive, it is recommended that the sample be considered HER2 negative without additional testing on the same specimen.

METHODS

• UW ONCOPLEX SINGLE GENE - Final result (07/24/2026 11:08 AM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

OncoPlex Single Gene Sequenced Gene SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
(NOTE)
PIK3CA,AKT1,PTEN

OncoPlex Single Gene Result 1) POSITIVE for an activating mutation in PIK3CA (p.C420R). 2) NEGATIVE for activating alterations in AKT1. 3) NEGATIVE for inactivating alterations in PTEN, see interpretation. 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

OncoPlex Single Gene Interpretation (NOTE) 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
1) The tested tumor sample is POSITIVE for an activating mutation in PIK3CA (p.Cys420Arg, NM_006218.4:c.1258T>C, VAF 27%, also known as p.C420R). Clinical data indicates breast carcinomas with PIK3CA activating mutations may respond to pathway specific inhibitors (Janku 2012). A combination of fulvestrant plus alpelisib is approved for use in a subset of patients with ER+ breast cancers with activating PIK3CA mutations (Andre 2019), and capivasertib, in combination with fulvestrant, is approved for us in ER+/HER2- breast cancers with PIK3CA, AKT1, or PTEN mutations (Turner 2023, Howell 2022, Jones 2020). It is not known if the tested neoplasm would be susceptible to therapies targeting the relevant pathways or if this patient would benefit from such a therapeutic approach.

2) The tested tumor sample is NEGATIVE for activating mutations, amplifications, and structural rearrangements in the tested regions of AKT1.

3) The tested tumor sample is also NEGATIVE for inactivating mutations, copy alterations, and structural rearrangements in the tested regions of PTEN.

UW-OncoPlex analysis was limited to PIK3CA, PTEN and AKT1. No other currently actionable mutations were otherwise detected in these genes. Some mutations in these genes will not be detected by this assay and not all detected variants are reported.

OncoPlex Single Gene Method SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
Sequences are aligned to the human genome reference (hg38). Test performed by targeted capture for listed genes followed by next-generation sequencing with Illumina technology.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine and Pathology. It has not been cleared or approved by the US Food and Drug Administration. This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

• MICROSATELLITE INSTABILITY BTY - Final result (07/24/2026 11:08 AM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

MSI Result 1. NEGATIVE for microsatellite instability.
2. Low tumor mutation burden, see interpretation.
MSI10 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Clinical History Right iliac crest: Metastatic carcinoma, SU26-28598, block A1, collected on 07-24-2026.
08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Interpretation SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
The sample tested is NEGATIVE for microsatellite instability with LOW tumor mutation burden (LESS THAN TEN mutations per Mb). Tumors without microsatellite instability are classified as microsatellite stable. This test can normally detect microsatellite instability if present in more than 20% of the cells in the sample.

Microsatellite instability has been extensively characterized in colorectal and endometrial cancer. False negative results in other cancer types cannot be excluded.

MSI Tumor Mutation Burden 5 mut/Mb 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Methods SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
Sequences are aligned to the human genome reference (hg38). Test performed by targeted capture for listed genes followed by next-generation sequencing with Illumina technology.

Microsatellite loci are amplified and sequenced on an Illumina instrument, as described [Salipante et al 2014].
Tumor mutational burden (TMB) is reported as the number of coding somatic variants per megabase of the coding region within the OncoPlex panel. TMB-High is defined as 10 or more mutations per megabase.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine and Pathology. It has not been cleared or approved by the US Food and Drug Administration. This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

Lynch syndrome screening is recommended for all patients diagnosed with endometrial or colorectal carcinoma, and microsatellite instability testing is the laboratory method used for screening patients at the University of Washington Medical Centers.

• POST PROCEDURE DIAG MAMMOGRAPHY LEFT - Edited Result - FINAL (07/22/2026 2:58 PM PDT)

Anatomical Region Laterality Modality

Breast Left Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Addenda

Addendum on 07/28/2026 4:42 PM PDT
Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:
Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and

alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.

Addendum on 07/28/2026 4:42 PM PDT
Pathology results reveal axillary node with metastatic carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/2026 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:
Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:

• PATHOLOGY, SURGICAL - Edited Result - FINAL (07/22/2026 1:10 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, HER2, and Ki67 testing. See Biomarker Summary template below.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

Addenda

Addendum on 07/23/2026 10:21 AM PDT
ADDENDUM:

Epic is an electronic system that healthcare organizations like UW Medicine and Fred Hutch Cancer Center use to manage patient care records. Epic experienced a technical issue that resulted in some notes by care team members not saving in some patients' charts.

Care team members are rapidly evaluating potentially affected charts to ensure that all chart notes are accurate. During this evaluation, the following small update was made to your chart. This addition was minor; you do not need to take any follow-up action and your care plan is not impacted. Please feel free to reach out to your care team if you have questions.

On review the following modifications or additional findings/impression text are needed:

IUD has been removed.

I have personally reviewed the images and agree with the report (or as edited).

Impressions

07/21/2026 1:37 PM PDT

* Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm.
* No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes.
* Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
* Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease.
* Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic disease is atypical for a breast

primary, and an alternative primary malignancy should be considered.

* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes.

* Moderately avid right axillary lymph node, concerning for metastatic.
  * Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast. Additional differential diagnosis include multiple myeloma, and lung adenocarcinoma.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/21/2026 1:37 PM PDT

This result has an attachment that is not available.

EXAMINATION:
PET MR F-18 FDG MID BODY

CLINICAL INDICATION:
cancer of unknown primary , metatatic to bone, assess for primary.
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Diagnostic mammogram from 7/15/2026 depicts BI-RADS 4 suspicious lesion in bilateral breasts. CEA is elevated at 28.6 ng/mL.

Imaging requested for diagnosis.

Initial treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,9.89 millicurie Intravenous,07/21/2026 0757
Injection site: Right antecubital fossa

TECHNIQUE:
Extent: Skull vertex to proximal thighs.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 100 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold MR images (3D T1 Dixon, axial T2) were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
CT chest, abdomen and pelvis 07/13/2026, mammography dated 07/15/2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.1
Mediastinal blood pool maximum SUV: 1.3
Liver mean SUV: 1.6.

Head and neck:
* Unremarkable.

Chest:
* Mild-to-moderate tracer uptake involving left lateral breast lesion measuring approximately 3.3 x 2.4 cm, with

max SUV of 1.9 (9/277, 12/207).
* No focal uptake above the right breast background.
* Subcentimeter left axillary lymph nodes with faint FDG uptake. Non specific.
* Moderately avid right axillary lymph node measuring 9 x 8 mm, with max SUV of 2.0 (9/290, 12/188).

Abdomen and Pelvis:
* Linear FDG uptake in the rectum that limits the evaluation for focal lesions. However not clear focal

Osseous structures:
Innumerable foci of intense FDG uptake in the axial and appendicular skeleton involving left condylar process of mandible, bilateral ribs, bilateral clavicles, left humerus, sternum, sacrum, bilateral pelvic bones, and bilateral femurs and multiple vertebral levels, with compression fractures of T4, T8 and L5 vertebrae. A few representative lesions are as follows:
* Right lamina of T5 vertebra, with max SUV of 9.7 (9/302, 2/171).
* Medial end of right clavicle, with max SUV of 9.7 (9/306, 2/166).
* Right iliac bone with max SUV of 11.3 (9/158, 12/373)
* Left posterolateral ninth rib with max SUV of 7.3, with associated soft tissue component (9/260, 12/230).

Extremities:
* Unremarkable.

Additional noncontrast MRI findings:
* Indeterminate right maxillary sinus T1 and T2 hyperintense lesion, without tracer uptake, likely representing a polyp or mucous retention cyst with proteinaceous contents.
* Dental amalgam is seen, with resultant artifacts.
* IUD in place.
* Small nabothian cysts seen.
* Small volume pelvic ascites, likely physiologic.

Procedure Note

Angela Castellanos R - 07/21/2026
Formatting of this note might be different from the original.
EXAMINATION:
PET MR F-18 FDG MID BODY

CLINICAL INDICATION:
cancer of unknown primary , metatatic to bone, assess for primary.
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Diagnostic mammogram from 7/15/2026 depicts BI-RADS 4 suspicious lesion in bilateral breasts. CEA is elevated at 28.6 ng/mL.

Imaging requested for diagnosis.

Initial treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,9.89 millicurie Intravenous,07/21/2026 0757
Injection site: Right antecubital fossa

TECHNIQUE:
Extent: Skull vertex to proximal thighs.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 100 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold MR images (3D T1 Dixon, axial T2) were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
CT chest, abdomen and pelvis 07/13/2026, mammography dated 07/15/2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.1
Mediastinal blood pool maximum SUV: 1.3
Liver mean SUV: 1.6.

Head and neck:
* Unremarkable.

Chest:
* Mild-to-moderate tracer uptake involving left lateral breast lesion measuring approximately 3.3 x 2.4 cm, with max SUV of 1.9 (9/277, 12/207).
* No focal uptake above the right breast background.
* Subcentimeter left axillary lymph nodes with faint FDG uptake. Non specific.
* Moderately avid right axillary lymph node measuring 9 x 8 mm, with max SUV of 2.0 (9/290, 12/188).

Abdomen and Pelvis:
* Linear FDG uptake in the rectum that limits the evaluation for focal lesions. However not clear focal

Osseous structures:
Innumerable foci of intense FDG uptake in the axial and appendicular skeleton involving left condylar process of mandible, bilateral ribs, bilateral clavicles, left humerus, sternum, sacrum, bilateral pelvic bones, and bilateral femurs and multiple vertebral levels, with compression fractures of T4, T8 and L5 vertebrae. A few representative lesions are as follows:
* Right lamina of T5 vertebra, with max SUV of 9.7 (9/302, 2/171).
* Medial end of right clavicle, with max SUV of 9.7 (9/306, 2/166).
* Right iliac bone with max SUV of 11.3 (9/158, 12/373)
* Left posterolateral ninth rib with max SUV of 7.3, with associated soft tissue component (9/260, 12/230).

Extremities:
* Unremarkable.

Additional noncontrast MRI findings:
* Indeterminate right maxillary sinus T1 and T2 hyperintense lesion, without tracer uptake, likely representing a polyp or mucous retention cyst with proteinaceous contents.
* Dental amalgam is seen, with resultant artifacts.
* IUD in place.
* Small nabothian cysts seen.
* Small volume pelvic ascites, likely physiologic.

IMPRESSION

* Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm.
* No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes.
* Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
* Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease.
* Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along

with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic disease is atypical for a breast primary, and an alternative primary malignancy should be considered.

* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes.

* Moderately avid right axillary lymph node, concerning for metastatic.
  * Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast. Additional differential diagnosis include multiple myeloma, and lung adenocarcinoma.

I have personally reviewed the images and agree with the report (or as edited).

• (ABNORMAL) MAM MAMMOGRAPHY DIAG W/TOMO BILAT (MAMMOGRAPHY DIAG W/TOMO BILATERAL) - Final result (07/15/2026 9:50 AM PDT)

Anatomical Region Laterality Modality

Breast Bilateral Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

07/15/2026 10:38 AM PDT

This result has an attachment that is not available.

Table formatting from the original result was not included.
Examination:
A targeted bilateral breast ultrasound was performed.
A digital diagnostic mammogram of both breasts was performed.
Tomosynthesis images were also obtained and reviewed as part of this examination. The results and recommendations of today's exam were discussed with the patient. The patient will also receive written notification of the results and recommendations from today's exam.

Reason for Exam:
47 year old with reason for exam of lytic bone lesions that are suspicious for mets with unknown primary.

Examinations Available for Comparison:
Comparison is made to images from: 04/10/2025 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, 12/29/2021 Ultrasound Breast Limited Bilateral - Imaging Storage, 12/29/2021 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, and 10/03/2020 Mammography Screening w/Tomo Bilateral - Imaging Storage

Density:
The breasts are extremely dense, which lowers the sensitivity of mammography.

Breast Cancer Risk Score
5-Year Risk Lifetime Risk to age 85 Notes

TC8 - Extremely Dense: 1.55%

TC8 - Extremely Dense: 13.59%

This is compared to risks for a woman of the same age:

5-year risk: TC8 - Extremely Dense: 1.13%
Lifetime risk: TC8 - Extremely Dense: 9.97%
Lifetime risk categories: Average risk <15%, Intermediate risk 15-25%, High risk >25%

For women with high (>25%) lifetime risk estimates, consider referral for further risk assessment and discussion of supplemental screening. Breast cancer risk consultation is available at Fred Hutchinson Cancer Center 206-606-2166 or at UWMC-Roosevelt 206-598-7749 or at UWMC-NW 206-668-6746.

Findings:

Left

Post-Surgical Finding

Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the left breast.

Mass

Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass

Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.

Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node

Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.

Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right

Post-Surgical Finding

Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst

Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the lower inner quadrant of the right breast, middle depth.

Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node

Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:

Left

1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right

1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:

Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass
Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left

breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node

Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right

Post-Surgical Finding

Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst

Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the lower inner quadrant of the right breast, middle depth.
Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node

Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:

Left

1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right

1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:
Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

• CT Chest with Contrast (CT CHEST W CONTRAST) - Final result (07/13/2026 10:36 AM PDT)

Anatomical Region Laterality Modality

Chest Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/13/2026 1:58 PM PDT

Impressions

07/13/2026 2:20 PM PDT

* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

Narrative

07/13/2026 2:20 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT CHEST W CONTRAST

CLINICAL INDICATION:
Lytic bone lesions on xray

TECHNIQUE:
CTB C1 CT Chest with intravenous contrast.
Computed tomography was obtained through the chest with intravenous contrast.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/13/2026 1036

COMPARISON:
None.

FINDINGS:
Supraclavicular region: Unremarkable.

Mediastinum: Unremarkable.

Heart and great vessels: Unremarkable.

Lungs: A few scattered nodules are noted, measuring up to 4 mm (for example 5/163).

Pleura: Unremarkable.

Chest wall: Unremarkable.

Upper abdomen: Unremarkable.

Bones:
* Multiple lytic lesions are noted, most prominently visible throughout the spine, particularly T4, T5, and T8 vertebral bodies, and also noted within the sternum and the ribs. Some lesions are expansile, the largest of which is in the left ninth rib (5/164), demonstrating a soft tissue component that measures approximately 27 x 16 mm (3/217).
* Fracture of the left 11th rib (5/207).

• CT Abdomen And Pelvis with Contrast (CT ABDOMEN AND PELVIS W CONTRAST) - Final result (07/13/2026 10:36 AM PDT)

Anatomical Region Laterality Modality

Abdomen and Pelvis N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/13/2026 11:24 AM PDT

Impressions

07/13/2026 3:59 PM PDT

Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/13/2026 3:59 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT ABDOMEN AND PELVIS W CONTRAST

CLINICAL INDICATION:
Lytic bone lesions on xray.
Pathological fracture, other site, initial encounter for fracture

TECHNIQUE:
CTB A2 CT Abdomen pelvis with intravenous contrast.
Computed tomography was obtained through the abdomen and pelvis with intravenous contrast only. Multiplanar reformatted images were performed.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/13/2026 1036

COMPARISON:
None.

FINDINGS:
Lower chest: Dictated separately.
Liver: Unremarkable with no suspicious focal lesion.

Gallbladder: Unremarkable.
Bile ducts: Unremarkable.
Spleen: Unremarkable.
Pancreas: No suspicious mass or duct dilation.
Adrenal glands: Unremarkable.
Kidneys and Ureters: Unremarkable.
Lymph Nodes: No enlarged lymph nodes.
Vasculature: Unremarkable.
Bowel: No obstruction or inflammatory bowel changes.
Reproductive organs: IUD in the uterus. Bilateral ovarian cysts, largest on the left measuring 2.1 x 1.6 cm.
Bladder: Unremarkable.
Peritoneum: Trace free fluid, likely physiologic.
Abdominal wall: Unremarkable
Bones: Multiple lytic lesions throughout the thoracolumbar spine and sacrum as well as the bilateral iliac bones.

FRED HUTCH AND UW MEDICINE

Patient Health Summary

Export date / 2026-11-18
MyChart export / DOC0001

Note from UW Medicine - Washington

This document contains information that was shared with Yvonne Kalley Franklin. It may not contain the entire record from UW Medicine - Washington.

Allergies

- Fentanyl (Other) - Low Criticality
- Propofol (Palpitations, Other) - Low Criticality

Medications

- propranolol 10 MG tablet
  Take 1 tablet by mouth daily.
- naloxone 4 MG/0.1ML nasal spray (Started 7/27/2026)
  Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- albuterol HFA 108 (90 Base) MCG/ACT inhaler
  Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing.
- tretinoin 0.025 % cream
  Apply 1 application topically 3 times a week. Apply to face.
- cholecalciferol 50 mcg (2,000 unit) capsule
  Take 2 capsules by mouth daily.
- polyethylene glycol 3350 17 g packet
  Take 1 packet by mouth daily. Dissolve in 4-8 ounce water.
- acetaminophen 325 MG tablet (Started 7/30/2026)
  Take 3 tablets by mouth every 8 hours.
- lidocaine viscous 2 % mouth/throat solution (Started 8/6/2026)
  Take 5 mL by mouth 4 times a day as needed (for throat pain). To avoid numbing tongue, use straw/applicator to apply to back of throat).
- pantoprazole 40 MG EC tablet (Started 8/6/2026)
  Take 1 tablet by mouth daily on an empty stomach.
- anastrozole 1 MG tablet (Started 8/21/2026)
  Take 1 tablet by mouth daily.
- ondansetron 8 MG tablet
  Take 1 tablet by mouth every 8 hours.
- senna 8.6 MG tablet (Started 10/6/2026)
  Take 2 tablets by mouth at bedtime as needed for constipation.

- prochlorperazine 10 MG tablet (Started 7/24/2026)
  Take 1 tablet by mouth every 6 hours as needed.
- Lidocaine 10 % cream (Started 7/13/2026)
  Apply 1 g topically.
- cyclobenzaprine 10 MG tablet (Started 4/24/2026)
  TAKE 1/2 TO 1 TABLET BY MOUTH THREE TIMES DAILY AS NEEDED FOR MUSCLE SPASMS
- citalopram 20 MG tablet (Started 8/5/2026)
  Take 1 tablet by mouth daily.
- meloxicam 15 MG tablet (Started 5/12/2026)
- oxyCODONE 10 MG tablet (Started 11/4/2026)
  Take 1 tablet by mouth every 3 hours as needed for moderate pain.
- morphine ER 15 MG ER tablet (Started 11/4/2026)
  Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours
- morphine ER 30 MG ER tablet (Started 11/4/2026)
  Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours
- ribociclib (400 mg dose) 200 MG tablet therapy pack (Started 11/6/2026)
  Take 2 tablets by mouth daily. Take daily on days 1-21 followed by 7 days off of each 28-day cycle.
- ribociclib (600 mg dose) 200 MG tablet therapy pack (Started 9/12/2026) (Discontinued)
  Take 3 tablets by mouth daily. Take on days 1 to 21 followed by 7 days off. Repeat every 28 days.
- oxyCODONE 10 MG tablet (Started 9/23/2026) (Discontinued)
  Take 1 tablet by mouth every 3 hours as needed for moderate pain.
- morphine ER 30 MG ER tablet (Started 10/6/2026) (Discontinued)
  Take 1 tablet by mouth every 8 hours. Take with a 15 mg tablet for a total of 45 mg every 8 hours
- morphine ER 15 MG ER tablet (Started 10/6/2026) (Discontinued)
  Take 1 tablet by mouth every 8 hours. Take with a 30 mg tablet for a total of 45 mg every 8 hours
- oxyCODONE 10 MG tablet (Started 10/26/2026) (Discontinued)
  Take 1 tablet by mouth every 3 hours as needed for moderate pain.

Results

• CT Mid-Spine with Contrast (CT T SPINE W CONTRAST) - Final result (11/16/2026 1:07 PM PST)

Anatomical Region Laterality Modality

T-spine N/A Positron Emission Tomography (PET)

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

11/18/2026 2:53 PM PST

Impressions

11/18/2026 3:34 PM PST

1. Slight interval progression and height loss of the pathologic compression deformity of C4 noted possibly 40% height loss without osseous retropulsion.
2. Slightly increased sclerotic appearance of numerous multifocal osseous lesions which likely represents posterior mass effect.

This is a preliminary report dictated by Thaddeus Wright, M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

11/18/2026 3:34 PM PST

This result has an attachment that is not available.

EXAMINATION:
CT C SPINE W CONTRAST, CT T SPINE W CONTRAST

CLINICAL INDICATION:
interval scan for known cervical lesion

TECHNIQUE:
CT Cervical Spine with contrast: routine (N-54)
Contiguous axial sections were obtained through the cervical spine from [the occiput] through [T3] following intravenous contrast. Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.
(accession 61124554), CT Thoracic Spine with contrast: Routine (N-60)
Contiguous axial sections were obtained from [C7] through [L1] following intravenous contrast Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure. exposure.
(accession 61124518)

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,40 mL Intravenous,11/16/2026 1302 (accession 61124554), IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,11/16/2026 1307 (accession 61124518)

Inferior Extent: L2

COMPARISON:
CT 7/27/2026, MRI 11/8/2026

FINDINGS:
CERVICAL SPINE:

ALIGNMENT: Straightening of the normal cervical lordosis.
VERTEBRAE: Pathologic compression deformity of C4 with approximately 40% height loss and no osseous retropulsion secondary to the lytic lesion involving nearly the entirety of the vertebral body. Similar height loss of T1 at the known additional pathologic depression fracture with approximately 25% height loss without osseous retropulsion. Otherwise overall similar size and number and distribution of numerous additional diffuse osseous metastatic lesions.
HARDWARE: No hardware present.
CORD: Visualized cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal.

LEVELS: No central or foraminal stenosis, facets are normal unless described separately below.
ABNORMAL LEVELS: None.

THORACIC SPINE:
ALIGNMENT: Focal kyphosis at T8 secondary to the pathologic compression deformity.
VERTEBRAE: Post kyphoplasty and pathologic compression fracture of T8 with approximately 50% height loss without osseous retropulsion. Slightly increased sclerosis of some of the known diffuse lytic lesions throughout the spine which may reflect treatment response. Similar additional multiple level compression deformities of T4 and T5. No new fractures.
HARDWARE: No hardware present.
SAGITTAL DISKS: Mild multilevel degenerative changes with slight height loss and endplate spurring.
CORD: Visualized throracic cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal. A CT chest is reported separately.

This result has an attachment that is not available.

EXAMINATION:
CT C SPINE W CONTRAST, CT T SPINE W CONTRAST

CLINICAL INDICATION:
interval scan for known cervical lesion

TECHNIQUE:
CT Cervical Spine with contrast: routine (N-54)
Contiguous axial sections were obtained through the cervical spine from [the occiput] through [T3] following intravenous contrast. Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.
(accession 61124554), CT Thoracic Spine with contrast: Routine (N-60)
Contiguous axial sections were obtained from [C7] through [L1] following intravenous contrast Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure. exposure.
(accession 61124518)

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,40 mL Intravenous,11/16/2026 1302 (accession 61124554), IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,11/16/2026 1307 (accession 61124518)

Inferior Extent: L2

COMPARISON:
CT 7/27/2026, MRI 11/8/2026

FINDINGS:
CERVICAL SPINE:

ALIGNMENT: Straightening of the normal cervical lordosis.
VERTEBRAE: Pathologic compression deformity of C4 with approximately 40% height loss and no osseous retropulsion secondary to the lytic lesion involving nearly the entirety of the vertebral body. Similar height loss of T1 at the known additional pathologic depression fracture with approximately 25% height loss without osseous retropulsion. Otherwise overall similar size and number and distribution of numerous additional diffuse osseous metastatic lesions.
HARDWARE: No hardware present.
CORD: Visualized cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal.

LEVELS: No central or foraminal stenosis, facets are normal unless described separately below.
ABNORMAL LEVELS: None.

THORACIC SPINE:
ALIGNMENT: Focal kyphosis at T8 secondary to the pathologic compression deformity.
VERTEBRAE: Post kyphoplasty and pathologic compression fracture of T8 with approximately 50% height loss without osseous retropulsion. Slightly increased sclerosis of some of the known diffuse lytic lesions throughout the spine which may reflect treatment response. Similar additional multiple level compression deformities of T4 and T5. No new fractures.
HARDWARE: No hardware present.
SAGITTAL DISKS: Mild multilevel degenerative changes with slight height loss and endplate spurring.
CORD: Visualized throracic cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal. A CT chest is reported separately.

SAGITTAL DISKS: Mild multilevel degenerative changes with slight height loss and endplate spurring.
CORD: Visualized throracic cord is normal size.
SOFT TISSUES: Paravertebral, interspinous, and posterior soft tissues are normal. A CT chest is reported separately.

IMPRESSION
1. Slight interval progression and height loss of the pathologic compression deformity of C4 noted possibly 40% height loss without osseous retropulsion.
2. Slightly increased sclerotic appearance of numerous multifocal osseous lesions which likely represents posterior mass effect.

This is a preliminary report dictated by Thaddeus Wright, M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

I have personally reviewed the images and agree with the report (or as edited).

EXAMINATION:
PET CT MID BODY

CLINICAL INDICATION:
restaging.

Imaging requested for restaging.

Subsequent treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,10.11 millicurie Intravenous,11/16/2026 1224
Injection site: Left antecubital fossa

TECHNIQUE:
Extent: Skull vertex to toes.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 94 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold CT images were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
PET/MR July 21, 2026, MRI CTL spine November 8, 2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.3
Mediastinal blood pool maximum SUV: 1.4
Liver mean SUV: 2.1.

Head and neck:
Unremarkable.

Chest:
* Similar mild uptake involving the left upper outer breast with SUV max 2.0 (12/167), previously SUV max 1.9.
* Previously seen hypermetabolic right axillary lymph node is less conspicuous.

Abdomen and Pelvis:
Unremarkable.

Osseous structures:
The previously seen numerous foci of FDG uptake throughout the axial and appendicular skeleton are markedly decreased, with few areas of residual uptake, for example:
* Decreased uptake at the left posterior ninth rib pathologic fracture with underlying lesion with SUV max 1.6 (12/206), previously SUV max 3 5.
* Decreased uptake at left proximal femur lytic lesion with SUV max 4.2 (12/401), previously SUV max 5.4.
* Similar uptake in the right femoral neck lytic lesion with SUV max 6.8 (12/392), previously SUV max 6.5.
* Decreased uptake in the right L5 vertebral body lytic lesion with SUV max 2.1 (12/305), previously with SUV max 5.4.

Extremities:
Unremarkable.

Additional noncontrast CT findings:
Please see separately dictated report for same-day contrast CT. No additional findings are identified on the

non-contrast CT performed for attenuation correction.

EXAMINATION:
MRI T SPINE WO/W CONTRAST

CLINICAL INDICATION:
Persistent T-spine pain

TECHNIQUE:
NEURO MRI Thoracic Spine without and with contrast: Extramedullary Tumor
Non-contrast: Sagittal T1, STIR, Axial T1, T2, in-out of phase
Post-contrast : Sagittal, axial T1 fat sat,

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,5.5 mmol Intravenous,11/08/2026 1305

COMPARISON:
Cervical, thoracic, lumbar spine MRI exam dated July 7, 2026

FINDINGS:
ALIGNMENT: Mildly decreased thoracic kyphosis, centered at the level of T5 and T8.
MARROW: Similar diffuse osseous metastatic disease involving multiple vertebral bodies in the thoracic spine, resulting in pathologic fractures at the level of T4, T5, and T8, losing approximately about 30%, 60%, and 65% of the vertebral height (801/9), significantly worsened compared to prior from July 2026. Index lesions including:
-Ill-defined enhancing lesion involving the entirety of the T1 vertebral body (2001/46)
-Ill-defined enhancing lesions involving the T4 T7 T10 and T11 vertebral body extending into the lamina and spinous processes
DISCS: Mild to moderate multilevel disc desiccation and disc height loss.
CORD: Mild intubation. Thecal sac at the level of T5 and T8, without extension metastatic disease. No other intra-axial extension of the osseous metastatic disease.
PARAVERTEBRAL SOFT TISSUES: Unremarkable
OTHER: Note of enhancing osseous metastatic disease in the sternum.

Avik Som IMG MRI PROCEDURES Final Result

• MRI L SPINE WO/W CONTRAST - Final result (11/08/2026 1:05 PM PST)

Anatomical Region Laterality Modality

L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

11/12/2026 8:28 AM PST

Impressions

11/12/2026 9:46 AM PST

Compared to MRI of lumbar spine September 24, 2026:

1. Multifocal osseous metastatic disease involving the lumbar spine, sacrum, and iliac bones, overall similar in distribution with decreased enhancement of several lesions. Unchanged pathologic compression deformity of L5.
2. Mild nonspecific enhancement of the L1 nerve roots, concerning for leptomeningeal disease.
3. Limited evaluation of the sacrum, though within this limitations, similar epidural extension at S1-S3 with mild thecal sac indentation.

The following findings are so common in normal, pain-free volunteers that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years who do not have back pain, an MRI will find that about:
* 8 in 10 have disk degeneration

* 7 in 10 have disk signal loss (desiccation)
* 6 in 10 have disk height loss
* 6 in 10 have a bulging disk
* 3 in 10 have an annular fissure
* 3 in 10 have a disk protrusion
Note that even 3 in 10 means that the finding is quite common in people without back pain.
(AJNR 2015; 6:811-6)j

FINAL REPORT: Agree with above. Mild epidural enhancement at mid L2, mid L4, mid L5 is also unchanged from the earlier study

I have personally reviewed the images and agree with the report (or as edited).

Narrative

11/12/2026 9:46 AM PST

This result has an attachment that is not available.

EXAMINATION:
MRI L SPINE WO/W CONTRAST

CLINICAL INDICATION:
Persistent symptoms

ADDITIONAL HISTORY:
Intermittent electric tingling down the posterior legs with neck flexion or extension
Metastatic breast cancer involving the T-spine with associated compression fractures; concern for progression

TECHNIQUE:
MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase
Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,5.5 mmol Intravenous,11/08/2026 1305

COMPARISON:
Lumbar spine MRI dated September 24, 2026

FINDINGS:
ALIGNMENT: Mild retrolisthesis of L4 on L5 (grade 1). Mildly decreased normal lumbar lordosis, likely positional.
MARROW:

- Heterogenous appearance of lumbar spine marrow with multiple ill-defined osseous metastatic lesions, which overall appear to be similar in distribution, with interval decrease in the extent of enhancement and some of the lesions. Index lesions includes:
-Lesion in the anterior aspect of the L3 vertebral body, measuring 0.8 x 1.4 cm (1901/54)
-Lesion in the anterior aspect of the L5 vertebral body, measuring 0.7 x 2.0 cm (1901/41)
-Lesion in the right L4 lamina, measuring 1.0 x 1.3 cm (1801/15, 1901/44)
-Partially visualized multiple lesions in the sacrum and bilateral iliac bones (1601/3)
- Similar pathologic compression deformity of the right aspect of the L5 vertebral body.

DISCS: Moderate L2-L3 and mild L5-S1 disc desiccation and disc height loss.
CORD: Mildly enhancing nerve roots of the level of L1 (1901/64). Conus ends normally at L2. Lumbar cord and cauda equina are normal.
PARAVERTEBRAL SOFT TISSUES: Unremarkable.

ENHANCEMENT: Similar extraosseous extension of the enhancing lesions, including:
- Similar epidural extension of the disease at the levels of S1, with mild indentation of the thecal sac (1801/9)
- Similar epidural extension of the disease at the level of S2 and S3, with mild indentation of the thecal sac (1501/10, 15 0 1/11)

IMPRESSION
Compared to MRI of lumbar spine September 24, 2026:

1. Multifocal osseous metastatic disease involving the lumbar spine, sacrum, and iliac bones, overall similar in distribution with decreased enhancement of several lesions. Unchanged pathologic compression deformity of L5.
2. Mild nonspecific enhancement of the L1 nerve roots, concerning for leptomeningeal disease.
3. Limited evaluation of the sacrum, though within this limitations, similar epidural extension at S1-S3 with mild thecal sac indentation.

The following findings are so common in normal, pain-free volunteers that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years who do not have back pain, an MRI will find that about:
* 8 in 10 have disk degeneration
* 7 in 10 have disk signal loss (desiccation)
* 6 in 10 have disk height loss
* 6 in 10 have a bulging disk
* 3 in 10 have an annular fissure
* 3 in 10 have a disk protrusion
Note that even 3 in 10 means that the finding is quite common in people without back pain.
(AJNR 2015; 6:811-6)j

FINAL REPORT: Agree with above. Mild epidural enhancement at mid L2, mid L4, mid L5 is also unchanged from the earlier study

I have personally reviewed the images and agree with the report (or as edited).

• MRI C SPINE WO/W CONTRAST - Final result (11/08/2026 1:05 PM PST)

Anatomical Region Laterality Modality

C-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

11/10/2026 11:04 PM PST

Impressions

11/10/2026 11:33 PM PST

1. Areas of enhancement within the cervical vertebrae have decreased overall since July 2026. This is consistent with therapeutic response.
2. New mild height loss of the C4 vertebral body since July 2026. This is consistent with a mild pathologic fracture. However, no significant narrowing of the spinal canal is identified at this level.
3. No evidence of intradural metastases are seen in the cervical spine. No cervical spinal cord abnormality identified.
4. Questionable mild size increase of bilateral cervical lymph nodes since July 2026. Consider a dedicated CT neck for further evaluation.

Narrative

11/10/2026 11:33 PM PST

This result has an attachment that is not available.

EXAMINATION:
MRI C SPINE WO/W CONTRAST

CLINICAL INDICATION:
47 yr old c/o numbness and tingling. Need MRI

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,5.5 mmol Intravenous,11/08/2026 1305

COMPARISON:
July 27, 2026.

FINDINGS:
ALIGNMENT: Mild reversal of the normal cervical lordosis is again seen. Mild retrolisthesis at C5-6 is unchanged.
MARROW: Heterogeneous marrow signal again seen in the cervical vertebrae. However, the areas of enhancement in the cervical spine have decreased overall since July 2026.

Mild height loss of the C4 vertebral body is new since July 2026. However, mild height loss of the C6 vertebral body is similar. No retropulsion of fracture fragments is identified.
DISCS: Discs are similar in height and signal intensity to the prior exam.
CORD: Visualized spinal cord is normal in signal and size. No abnormal cord or intradural enhancement.
PARAVERTEBRAL SOFT TISSUES: Small bilateral cervical lymph nodes. Questionable mild size increase since July 2026. However, these would be better assessed on a dedicated CT neck.

AXIAL DISCS, DURAL COMPRESSION & FORAMINA:
C2-3: No central or foraminal stenosis. Facets are normal.
C3-4: No foraminal stenosis. Mild central stenosis. Unchanged from July 2026.
C4-5: No foraminal stenosis. Mild central stenosis. Unchanged.
C5-6: No foraminal stenosis. Mild central stenosis. Unchanged.
C6-7: No foraminal stenosis. Mild central stenosis. Unchanged.
C7-T1: No central or foraminal stenosis.

• XR T SPINE 2 VW - Final result (10/30/2026 1:44 PM PDT)

Anatomical Region Laterality Modality

T-spine N/A Digital Radiography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

10/31/2026 12:54 AM PDT

Impressions

10/31/2026 1:10 AM PDT

Thoracic spine:

Compared with the August 28, 2026 CT, there appears to be relatively stable appearance of the T1 and T4 mild compression fractures but apparent progression of the T5 anterior wedging with height loss of approximately 55% compared with prior approximately 40%. There is also slight increased focal kyphosis with Cobb angle of approximately 21 degrees between bottom of T4 and top of T6 on the standing x-rays versus approximately 7 degrees on the supine CT.

There appears to be questionable minor progression of the T8 vertebral anterior wedge compression fracture status post vertebroplasty with approximately 60% anterior height loss versus approximately 50% on the September 16, 2026 procedure x-rays appears relatively similar focal kyphosis measuring degrees between bottom of T7 and top of T9.

The thoracic vertebral bodies are otherwise intact and in anatomic alignment on the lateral view. There is minimal right convex scoliosis centered at approximately T5/6.. There are mild degenerative disc changes in the mid and lower thoracic spine. Multiple lytic and blastic bony lesions are better seen on prior CT and MR grossly stable. A paper clip is noted along the back which is centered at the approximate T8/9 level presumably indicating level of pain.

Lumbar spine:

The lumbar vertebral bodies are intact and in similar alignment on the lateral view again with mild retrolisthesis at

L5/S1 and minimal retrolisthesis at L4/5.. There are mild to moderate degenerative disc changes at L5/S1 with disc height loss, osteophytes, and facet sclerosis. There are mild degenerative changes at L2/3 and L4/5. Patient is status post vertebroplasty at S1 which appears relatively stable. Lytic and blastic lesions are grossly stable but better seen on prior CT and MRI. No new fractures or subluxations. The paperclip present along the surface of the lower back centered at the L5/S1 level.

• Brain MRI (MRI BRAIN TUMOR/METASTASIS) - Final result (09/24/2026 7:21 PM PDT)

Anatomical Region Laterality Modality

Brain N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

09/25/2026 12:03 AM PDT

Impressions

09/25/2026 12:13 AM PDT

1. Essentially negative brain MRI without evidence of metastases or cause of headaches identified.

Narrative

09/25/2026 12:13 AM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI BRAIN TUMOR/METASTASIS

CLINICAL INDICATION:
breast cancer, HA , eval for CNS mets
Secondary malignant neoplasm of bone

TECHNIQUE:
MRI Head without and with contrast: Tumor (Primary) (B 2PT)
Non-contrast: Axial T1, T2, DWI, Post-contrast : Sagittal 3D FLAIR. Sagittal, axial and coronal T1

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,11 mL Intravenous,09/24/2026 1921

COMPARISON:
Head CT August 16, 2026 and head CT/CTA July 27, 2026..

FINDINGS:

MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.

BRAIN: There are several tiny periventricular and deep white matter foci of high FLAIR signal. These are nonspecific but most commonly incidental and related to age related microvascular changes. The brain parenchyma is otherwise unremarkable. No hemorrhage or mass lesion is seen .

ENHANCEMENT: There is a tiny 1 to 2 mm focus of enhancement along the left precentral gyrus visible on the turbo spin-echo axial images (series 1601, image 143) but not identified on the SPGR postcontrast or FLAIR images and appears somewhat linear on the sagittal turbo spin-echo reconstructions (series 1603, image 73) and most likely represents an incidental prominent vein however attention this region may be helpful on future scans. There is no correlating enhancement or apparent vessel on the July 27, 2026 CTA.

VASCULAR: Cavernous carotid, vertebral, and other intracranial vascular flow voids are normal

EXTRA-AXIAL: Extra-axial spaces are normal.

EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear with incidentally noted minor right maxillary sinus small mucous retention cysts.. Orbits are normal.

Amy N West IMG MRI PROCEDURES Final Result

• MRI L SPINE WO/W CONTRAST - Final result (09/24/2026 7:21 PM PDT)

Anatomical Region Laterality Modality

L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

09/25/2026 4:59 PM PDT

Impressions

09/25/2026 9:22 PM PDT

In comparison to MRI lumbosacral spine 7/27/2026:

1. Accounting for differences in technique, similar appearance and extent of multilevel diffuse enhancing osseous metastasis with epidural extension as detailed above.
2. Most notably, expansile soft tissue within S2 and S3 with ventral epidural extension and mild deformation of the ventral thecal sac, as well as extension into the right S2 neuroforamina.
3. Slightly improved encasement of the right S2 nerve root at the level of the foramina.

The following findings are so common in normal, pain-free volunteers that while we report their presence, they must be interpreted with caution and in the context of the clinical situation. Among people between the age of 40 and 60 years who do not have back pain, an MRI will find that about:

* 8 in 10 have disk degeneration
* 7 in 10 have disk signal loss (desiccation)
* 6 in 10 have disk height loss
* 6 in 10 have a bulging disk
* 3 in 10 have an annular fissure
* 3 in 10 have a disk protrusion

Note that even 3 in 10 means that the finding is quite common in people without back pain.
(AJNR 2015; 6:811-6)

ATTENDING FINAL REVIEW:

I agree with the preliminary report.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

09/25/2026 9:22 PM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI L SPINE WO/W CONTRAST

CLINICAL INDICATION:
metastatic Lt breast cancer (ER+/PR+/Her2-) diffusely to bone with lesions along the entire spinal axis with diffuse T-spine pain s/p 8 Gy x1 to C4-T11, kyphoplasty to T8 and S1 on 9/16, SBRT planning, also with new sacrum pain

TECHNIQUE:
MRI Lumbar Spine without and with contrast for radiation treatment planning. FOV centered at treatment level.
Pre Contrast: 2D T1, 3D T1, 3D T2, Cardiac Triggered BFFE, DTI
Post Contrast: DCE T1, 3D T1 Fat Sat

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,11 mL Intravenous,09/24/2026 1921

COMPARISON:
MRI lumbosacral spine 7/27/2026

FINDINGS:
ALIGNMENT: Normal
MARROW: Diffuse T1 hypointense, enhancing osseous metastasis. Redemonstrated pathologic compression deformity of the right aspect of the L5 vertebral body. The vertebral body heights are otherwise well-maintained.
DISCS: Mild multilevel disc height loss and disc desiccation.
CORD: Conus ends at L2. Visualized cord and cauda equina are normal.
PARAVERTEBRAL SOFT TISSUES: Normal
ENHANCEMENT: Extraosseous extension of enhancing tumor as detailed below:
* Similar ventral epidural extension at L2, L3, and L5 (right aspect) without deformation of the thecal sac.
* Similar ventral epidural extension at S1 with mild indentation of the ventral thecal sac.
* Similar expansile enhancing soft tissue within S2 and S3 with ventral epidural extension and mild indentation of the ventral thecal sac, as well as extension into the right S2 neuroforamina. Slightly improved encasement of the right S2 nerve root at the level of the foramina.

AXIAL DISCS, DURAL COMPRESSION & FORAMINA: As above. Otherwise, no high-grade central canal or foraminal stenosis.

T8 and S1 unipedicular kyphoplasty and ablation.
S1 biopsy

PLAN:Follow-up in clinic in one month.

Narrative

09/16/2026 6:10 PM PDT

This result has an attachment that is not available.

PROCEDURE:
NIR ANGIO VERTEBROPLASTY, kyphoplasty and ablation of T8 and S1. Biopsy of S1

PRE-PROCEDURE DIAGNOSIS:
Metastatic breast cancer

POST-PROCEDURE DIAGNOSIS:
Same.

CONSENT:
The risks, benefits, and alternatives of the planned procedure were explained in detail to the patient. Questions were answered and written informed consent was obtained.

TIME OUT:
A time out and final verification was done by the entire team to verify patient, procedure, and site.

STERILE PREPARATION:
All elements of maximal sterile barrier technique were followed, including use of cap, mask, sterile gown, gloves,

sterile sheet, chlorhexidine 2% isopropyl alcohol or povidone-iodine, and appropriate hand hygiene.

ANESTHESIA/SEDATION:
Anesthesia supervision: Dirrect monitoring by Interventional Radiology physician performing procedure, and administered by appropriately credentialed nurse.

Level of anesthesia achieved: Moderate sedation: Nurse or other qualified health professional providing continuous monitoring of sedation and vital signs throughout the procedure

DESCRIPTION OF PROCEDURE AND FINDINGS:
Procedure:
The patient was brought to the angiography suite and placed prone upon the examination table. The patient was prepped and draped in the usual sterile fashion. The T7 vertebral levels were identified and targeted using fluoroscopy. The soft tissues above the unilateral T8 and S1 pedicles were anesthetized using lidocaine via a 25G needle and subsequently a 22G spinal needle. With a unipedicular transpedicular approach, separate 11G needles were placed into the lateral aspect of the T8 and S1 vertebral bodies under fluoroscopic guidance with position confirmed under lateral and frontal projections. S1 was repeatedly assessed with repeat cone beam CTs. Biopsy of S1 was performed through the left transpedicular approach.

Subsequent evaluation demonstrated adjustable radiofrequency probe placed through the left T8 and S1 pedicle and curved medially and superiorly. Additionally, radiofrequency probes were placed through T8 and S1 pedicles and curved superomedially and inferomedially. Radiofrequency ablation was then performed to the appropriate and targeted the 50 degrees Celsius. Radiofrequency probes were then removed.

Methylmethacrylate was mixed and injected through both needles under direct fluoroscopic visualization. Subsequently, needles were removed. The patient tolerated the procedure well with no immediate complications.

T8 and S1 was done in sequence. T8 was done first, and then S1.

FINDINGS:
Initial evaluation delineated successful bilateral pedicular needle placement and subsequent fluoroscopic spot film demonstrated good needle tip positioning within the T8 and S1 vertebrae.
Subsequent evaluation then demonstrated ablation and augmentation as described above with final films demonstrating good vertebral fill and no significant extraosseous extension. There is a small amount of cement extravasation into the right S1 neural foramina that appears largely open on final cone beam CT. .

RADIATION DOSE:
Fluoroscopy time for this procedure was 25 minutes.

ESTIMATED BLOOD LOSS:
Minimal.

SPECIMENS OBTAINED:
None

COMPLICATIONS:
None.

• PATHOLOGY, SURGICAL - Final result (09/16/2026 5:06 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Final Diagnosis A) Sacrum, biopsy:
- Cytokeratin-positive cells in a background of blood and bone marrow, consistent with metastatic carcinoma.
- See comment.

COMMENT:
The specimen contains blood clot and fragments of bone marrow with scattered cytokeratin AE1/AE3 positive cells, consistent with carcinoma and morphologically consistent with metastatic carcinoma of breast origin.

ADDENDUM:

ADDENDUM:

I have personally reviewed the images and agree with the report (or as edited).

Impressions

08/28/2026 1:36 PM PDT

Normal alignment

Redemonstrating multifocal lytic osseous metastasis throughout the thoracic spine and pathological fracture involving T1, T4, T5, and T8 with approximately 60-70% height loss. Better evaluated in CT spine of the same day.

Mild degenerative changes without significant neural foraminal narrowing or spinal stenosis.

Anatomical Region Laterality Modality

T-spine, L-spine N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

08/29/2026 6:41 AM PDT

This result has an attachment that is not available.

PROCEDURE: CT scan of the thoracolumbar spine. August 28, 2026 0850 hours

Clinical History: Thoracic and lumbar metastasis. Evaluate for compression fractures. Please extend to include sacrum and pelvis.

Technique: Helical axial sections with sagittal and coronal reformats of the thoracolumbar spine were obtained with intravenous contrast. Iterative reconstruction technique was employed to reduce patient radiation exposure.

Radiation Dose: Total exam DLP 519 mGy/cm.

Comparison: Compared with the prior CT whole spine study dated July 27, 2026 and correlated with the prior MR spine study dated July 27, 2026

Findings:
Straightening of the thoraco-lumbar spine. Multifocal lytic lesions involving in vertebral bodies and posterior elements, unchanged since the prior study.
Again seen are compression fracture deformities of the T1, T4, T5 and T8 vertebral bodies with a mild reduction in the vertebral body heights, similar to the prior CT and MRI study. Again seen is extraosseous soft tissue extension of the right transverse process lytic lesion resulting in right T8/T9 neural foraminal narrowing, also unchanged since the prior study.
There is a similar dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 2.6 x 1.6 cm in axial dimensions (image 798, series 304). The lesion compresses anterior thecal sac.
Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal, unchanged.
Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles, unchanged.

Impression:
Multifocal lytic lesions involving the axial and appendicular skeleton with compression fracture deformities of the thoracic vertebrae and similar dominant soft tissue component surrounding the S1, S2/S3 lytic lesions causing canal compromise as detailed above.

Date of Order: 8/28/2026 1:06:00 PM

• CT SCAN HEAD W/O CONTRAST (CT HEAD W/O CONTRAST) - Final result (08/16/2026 7:39 PM PDT)

Anatomical Region Laterality Modality

Head N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

08/16/2026 8:08 PM PDT

Impressions

08/16/2026 9:14 PM PDT

1. No acute intracranial abnormality.

This is an afterhours preliminary report generated by Sina Hosseinian, PGY-3. Unless an attending attestation appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW

I agree with the preliminary report with the following comment:

Osseous lytic lesion in the left mandibular condyle with cortical breakthrough posteriorly (302/9, 10).

I have personally reviewed the images and agree with the report (or as edited).

Narrative

08/16/2026 9:14 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT HEAD W/O CONTRAST

CLINICAL INDICATION:
headache, hx breast cancer

TECHNIQUE:
5 mm MDCT images from skull base to vertex without contrast. Patient age specific parameters were used for radiation exposure.

COMPARISON:
CT head 7/27/2026

FINDINGS:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Cavernous carotids and vertebral vessels are normal.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Right maxillary sinus mucous retention cyst, otherwise the sinuses and mastoids are clear. Orbits are normal.

Procedure Note

Heba Fouad - 08/16/2026
Formatting of this note might be different from the original.

• CTA Chest PE With Contrast (CTA CHEST PE W CONTRAST) - Final result (08/12/2026 3:50 PM PDT)

Anatomical Region Laterality Modality

Chest Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

08/12/2026 4:04 PM PDT

Impressions

08/12/2026 6:06 PM PDT

1. No evidence of acute pulmonary embolism.
2. Multiple lytic lesions as above, which have increased compared to prior. There are multiple new/worsening pathologic compression fractures involving the multiple thoracic vertebral bodies as above. Mild retropulsion of the T5 and T8 vertebral body fractures.
3. Multiple lytic rib lesions many of which involve the cortex. Increase in size of soft tissue component of the left 9th lytic rib lesion. New subacute fracture of the left 7th rib.
4. Left greater than right small lower lobe consolidations, likely atelectasis. Superimposed aspiration can't be excluded.
5. Similar solid pulmonary nodules. No new or enlarging nodules. Consider follow-up per oncology protocol.

COMMUNICATION:
The above was communicated by telephone to Sutanthavibul, ARNP by Lee, MD at 8/12/2026 4:52 PM.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

08/12/2026 6:06 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CTA CHEST PE W CONTRAST: PULMONARY EMBOLISM PROTOCOL

CLINICAL INDICATION:
ACE: 47yoF breast ca with mets to bone, worsening bilateral rib pain L>R anterior and lateral sides. Conern for metastatic lesions vs. PE.

TECHNIQUE:
CTB C3 CTA Chest Suspected pulmonary embolus.
Contiguous axial sections were obtained through the chest with IV contrast. Multiplanar reformatted images were performed. Axial MIPs were generated on the CT scanner console. Automated exposure control and statistical iterative reconstruction techniques substantially lowered patient radiation dose.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,50 mL Intravenous,08/12/2026 1550

COMPARISON:
CT chest on 7/13/2026.

FINDINGS:
Pulmonary artery findings: No evidence of acute pulmonary embolism.
The RV/LV ratio is less than 1, indicating no right ventricular pressure overload.

Supraclavicular region: Unremarkable.
Mediastinum: Unremarkable.
Heart: Unremarkable.
Lungs: Left greater than right small lower lobe consolidations. Bronchial wall thickening an scattered mucous plugging. Similar solid pulmonary nodules, for example 4 mm in the left lower lobe (305/177). No new or enlarging pulmonary nodules.
Pleura: Unremarkable.
Chest wall: Unremarkable.
Upper abdomen: Limited pulmonary arterial phase views of the upper abdomen are unremarkable.
Bones:
* Multiple lytic lesions within the bilateral ribs, spine, and sternum, are probably increased when compared to prior.
* Multiple new and/or worsening pathological compression fractures involving the T1, T5, and T8 vertebral bodies (602/56). There is 2 mm of retropulsion of the T5 vertebral body (602/56) and minimal retropulsion of the T8 vertebral body.
* Increased fracture of the T12 vertebral body now involving more of the inferior endplate (602/54). New pathologic fracture of the T10 inferior endplate (602/55).
* Left 9th rib lytic lesion with soft tissue component measuring 3.0 x 1.8 cm (305/150) previously 2.7 x 1.6 cm. Multiple chronic pathologic rib fractures. New subacute fracture of the left 7th rib (305/131).
* Multiple lytic rib lesions involve the cortex, for example (304/133, 304/68, 304/86).

• XR T SPINE 3 VW - Final result (07/28/2026 2:27 PM PDT)

Anatomical Region Laterality Modality

T-spine N/A Digital Radiography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 4:06 PM PDT

Impressions

07/28/2026 4:14 PM PDT

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

Narrative

07/28/2026 4:14 PM PDT

This result has an attachment that is not available.

EXAMINATION:
XR T SPINE 3 VW

CLINICAL INDICATION:
Localize levels of pain in spine

• MRI C T L SPINE WO/W CONTRAST (MRI C-T-L SPINE WO/W CONTRAST) - Final result (07/27/2026 11:57 PM PDT)

Anatomical Region Laterality Modality

C-spine, T-spine, L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 1:12 AM PDT

Impressions

07/28/2026 1:42 AM PDT

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
   Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/28/2026 1:42 AM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI C-T-L SPINE WO/W CONTRAST

CLINICAL INDICATION: Stage IV breast cancer.
metastatic cancer, lytic lesions in spine, spinal stenosis

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,6 mmol Intravenous,07/27/2026 2357

COMPARISON:
CT 7/27/2026.

FINDINGS:

SPINAL CORD: The conus medullaris terminates at the level of L1-L2, was in normal limits. There is no abnormal cord signal or abnormal cord enhancement.

SPINE: Mild apparent straightening of the normal cervical lordosis could be positional. The normal thoracic kyphosis is maintained. There is mild apparent straightening of the normal lumbar lordosis. Small central disc protrusions are seen at C3-C4, C5-C6 and C6-C7 as well as L2-L3 and L3-L4 resulting in impression of the ventral thecal sac. There is no significant canal or foraminal stenosis.

There is diffuse osseous metastasis in the cervical, thoracic, lumbar and sacral vertebral bodies as well as posterior elements.There are mild compression fractures involving T4, T5 (40% height loss) and T8 vertebral bodies. Possible fluid fluid level at T5 may represent hemorrhage within the vertebral body. L3 vertebral body demonstrates superior and inferior endplate Schmorl's nodules.

There is anterior epidural soft tissue extension at T5 (series 1301 image 10/17) and T8 (series 1601 image 18/62 without cord compression. There may also be possible epidural extension at T4.

Procedure Note

• CTA HEAD AND NECK ANGIO - Final result (07/27/2026 8:17 PM PDT)

Anatomical Region Laterality Modality

Brain N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/27/2026 9:18 PM PDT

Impressions

07/27/2026 9:48 PM PDT

1. Normal head CT. No acute infarct, hemorrhage or mass effect.
2. Normal CTA head. No high-grade stenosis or occlusion.
3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:
I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 9:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CTA HEAD AND NECK ANGIO

CLINICAL INDICATION:
metastatic cancer, pathologic neck fractures, NSGY requesting vascular imaging

TECHNIQUE:
CTA Head and Neck Stroke (N-48)
1. Non-contrast head: Contiguous axial sections were obtained through the head without contrast.
2. CTA Head/Neck: Contiguous axial sections were obtained from the aortic arch to the vertex during bolus infusion of contrast. Slab MIP reformatted images of extracranial and intracranial vessels were obtainedmultiple planes. 3. Post-contrast head: Contiguous axial sections were obtained through the head after contrast injection. Patient age specific scan parameters were used for radiation exposure.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,100 mL Intravenous,07/27/2026 2017

COMPARISON:
Same-day CT full spine.

FINDINGS:

NON-CONTRAST HEAD CT:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Cavernous carotids and vertebral vessels are normal.

EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear. Bilateral lens placements. Dental hardware..

POST-CONTRAST HEAD CT:
ENHANCEMENT: Normal intracranial enhancement.

HEAD CTA:
ARTERIES: Normal intracranial arteries. No aneurysm, AVM, stenosis or occlusion.
VARIANTS: Fetal origin of the left posterior cerebral artery. The right posterior communicating artery is diminutive..
VEINS: Dural sinuses and deep venous structures are normal.

NECK CTA:
AORTIC ARCH: Aortic arch and great vessel origins are unremarkable, bovine arch.
CAROTIDS: Common carotid vessels are normal. Internal carotid artery origins show no stenosis. Cervical ICA's are normal.
VERTEBRALS: Vertebral artery origins are normal. Cervical vertebral segments are normal.

Diffuse osseous lesions of the spine are described on same-day CT full spine.

Procedure Note

Impressions

07/27/2026 5:18 PM PDT

* Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR.
* No definite new evidence of significant vertebral fracture or subluxation.
* Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.
* Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck

CTA to evaluate luminal patency if clinically warranted.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 5:18 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT FULL SPINE W CONTRAST

CLINICAL INDICATION:
ACE patient - newly dx metastatic breast cancer. Acute on chronic bilateral cervical pain and left sided thoracic/lumbar pain.

COMPARISON: PET/MR on 07/21/2026; Spinal MRI on 07/01/2026

TECHNIQUE:
Contiguous axial sections were obtained through the cervical, thoracic, and lumbar spine from the occiput through sacrum with contrast.? Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.?

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/27/2026 1500

FINDINGS:

CERVICAL SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the C4 lesion involving the left pedicle. Mild height loss of C4 and C6 vertebrae.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES: No appreciable epidural soft tissue mass in this CT exam. Some extra-osseous soft tissue extension of the left C4 and C6 lateral transverse process lytic lesions, resulting in left foraminal canal narrowing.

THORACIC AND LUMBAR SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the T8 lesion involving the right pedicle. Mild compression fractures (<25%), for example T1, T4, T5, and T8 levels, grossly similar to 07/01/2026 thoracic spine MRI.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES:
* Some extra-osseous soft tissue extension of the right T8 transverse process lytic lesions, resulting in right T8/9 foraminal canal narrowing.
* One dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 29 x 34 mm in axial dimensions (304/686). The lesion compresses anterior thecal sac. Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal.

EXTRA-SPINAL FINDINGS:
Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles. Otherwise, no acute findings identified. Please refer to the recent PET/MRI for extraspinal disease.

Impressions

07/24/2026 12:48 PM PDT

Technically successful and uneventful CT guided core needle biopsy of the right iliac lesion.

PRESENCE STATEMENT:
I, Dr. Chankue Park, was present during the entire procedure. I have personally reviewed the images and agree with the report (or as edited).

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/24/2026 12:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT SUPERFICIAL BONE BX

CLINICAL INDICATION:
widespread bony mets, unkonwn primary, likely solid tumor.

PREPROCEDURE:
CT reveals lytic lesion over the right iliac bone.

TECHNIQUE:
Details of the procedure were discussed with the patient and written informed consent was obtained. Specifically, the risks, benefits, and alternatives of the procedure were discussed, including, but not limited to, bleeding, infection, pain, damage to adjacent structures, and nondiagnostic specimen. The patient was able to ask questions, indicated their understanding, and agreed to proceed.

A final time out was performed prior to commencing with the procedure.

SEDATION:
Incremental doses of intravenous midazolam and fentanyl was administered by the radiology nurse for moderate sedation with direct monitoring by the attending physician. Continuous hemodynamic and respiratory monitoring was performed throughout and following the procedure.

Duration of sedation: 60 minutes with 200 mcg fentanyl and 4mg versed. Please refer to sedation report for further details.

PROCEDURE:
The patient was directed into the supine. Skin over the right iliac was marked with CT guidance. The skin was then cleansed and draped. Adequate local anesthesia was achieved with subcutaneous 1% lidocaine. Under incremental CT guidance, a 14-gauge Bonopty coaxial penetrating needle was advanced through the cortex. An 18-gauge soft tissue biopsy needle was then advanced through the coaxial system into the right anterior iliac crest lytic lesion. 4 samples of 1-2 cm tan white tissue were obtained along with multiple fragmented tissues.

Needle was removed and hemostasis easily achieved. No immediate complications.

POSTPROCEDURE:
CT did not reveal any complications such as significant hemorrhage or pneumothorax.

Postprocedure orders were given to the patient and were documented in the patient's chart. Patient was sent to the floor with no discomfort or pain and in stable condition.

Specimen was sent to pathology department.

Procedure Note

• PATHOLOGY, SURGICAL - Edited Result - FINAL (07/24/2026 12:26 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 2 ADDENDUM REASON:
This addendum is issued to report the results of HER2 FISH testing performed. See Biomarker Summary template below. 08/13/2026 1:52 PM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY Addendum electronically signed by Dintzis, Suzanne Martha, MD on 8/13/2026 at 1352 PDT

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, and HER2 testing. See Biomarker Summary template below.

HER2 FISH studies have also been ordered and will be reported in a subsequent addendum.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

(Added in Addendum) BREAST BIOMARKER REPORTING TEMPLATE - All Specimens
Protocol posted: 6/18/2025

Testing Performed on Specimen / Block Number(s): A1
Test(s) Performed:
HER2 by In Situ Hybridization (ISH) Status: Negative, based on IHC and ISH results
: Group 4 ISH result (with IHC 0-2+)
HER2 ISH Testing Signal Counts and Ratio:
Average Number of HER2 Signals per Cell: 4.35

Average Number of CEP17 Signals per Cell: 3.39
HER2 / CEP17 Ratio: 1.28
Comment(s) on HER2 ISH Results: This sample has a Group 4 result (ratio less than 2.0; greater than or equal to 4.0 and less than 6.0 HER2 signals / cell). It is uncertain whether patients with greater than or equal to 4.0 and less than 6.0 average HER2 signals / cell and HER2 / CEP17 ratio less than 2.0 benefit from HER2 targeted therapy in the absence of protein overexpression (IHC 3+). If the specimen test result is close to the ISH ratio threshold for positive, there is a high likelihood that repeat testing will result in different results by chance alone. Therefore, when IHC results are not 3+ positive, it is recommended that the sample be considered HER2 negative without additional testing on the same specimen.

METHODS
Cold Ischemia and Fixation Times: Cannot be determined: Cold ischemia and formalin fixation times not documented.
Fixative: Formalin

• UW ONCOPLEX SINGLE GENE - Final result (07/24/2026 11:08 AM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

OncoPlex Single Gene Sequenced Gene SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
(NOTE)
PIK3CA,AKT1,PTEN

OncoPlex Single Gene Result 1) POSITIVE for an activating mutation in PIK3CA (p.C420R). 2) NEGATIVE for activating alterations in AKT1. 3) NEGATIVE for inactivating alterations in PTEN, see interpretation. 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

OncoPlex Single Gene Interpretation (NOTE) 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
1) The tested tumor sample is POSITIVE for an activating mutation in PIK3CA (p.Cys420Arg, NM_006218.4:c.1258T>C, VAF 27%, also known as p.C420R). Clinical data indicates breast carcinomas with PIK3CA activating mutations may respond to pathway specific inhibitors (Janku 2012). A combination of fulvestrant plus alpelisib is approved for use in a subset of patients with ER+ breast cancers with activating PIK3CA mutations (Andre 2019), and capivasertib, in combination with fulvestrant, is approved for us in ER+/HER2- breast cancers with PIK3CA, AKT1, or PTEN mutations (Turner 2023, Howell 2022, Jones 2020). It is not known if the tested neoplasm would be susceptible to therapies targeting the relevant pathways or if this patient would benefit from such a therapeutic approach.

2) The tested tumor sample is NEGATIVE for activating mutations, amplifications, and structural rearrangements in the tested regions of AKT1.

3) The tested tumor sample is also NEGATIVE for inactivating mutations, copy alterations, and structural rearrangements in the tested regions of PTEN.

UW-OncoPlex analysis was limited to PIK3CA, PTEN and AKT1. No other currently actionable mutations were otherwise detected in these genes. Some mutations in these genes will not be detected by this assay and not all detected variants are reported.

Comment:
Sequences are aligned to the human genome reference (hg38). Test performed by targeted capture for listed genes followed by next-generation sequencing with Illumina technology.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine and Pathology. It has not been cleared or approved by the US Food and Drug Administration. This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

• MICROSATELLITE INSTABILITY BTY - Final result (07/24/2026 11:08 AM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

MSI Result 1. NEGATIVE for microsatellite instability.
2. Low tumor mutation burden, see interpretation.
MSI10 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Clinical History Right iliac crest: Metastatic carcinoma, SU26-28598, block A1, collected on 07-24-2026.
08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Interpretation SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
The sample tested is NEGATIVE for microsatellite instability with LOW tumor mutation burden (LESS THAN TEN mutations per Mb). Tumors without microsatellite instability are classified as microsatellite stable. This test can normally detect microsatellite instability if present in more than 20% of the cells in the sample.

Microsatellite instability has been extensively characterized in colorectal and endometrial cancer. False negative results in other cancer types cannot be excluded.

MSI Tumor Mutation Burden 5 mut/Mb 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

MSI Methods SEE NOTES 08/13/2026 3:39 PM PDT UWMC Montlake Dept of Lab Med

Comment:
Sequences are aligned to the human genome reference (hg38). Test performed by targeted capture for listed genes followed by next-generation sequencing with Illumina technology.

Microsatellite loci are amplified and sequenced on an Illumina instrument, as described [Salipante et al 2014].
Tumor mutational burden (TMB) is reported as the number of coding somatic variants per megabase of the coding region within the OncoPlex panel. TMB-High is defined as 10 or more mutations per megabase.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine and Pathology. It has not been cleared or approved by the US Food and Drug Administration. This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

Lynch syndrome screening is recommended for all patients diagnosed with endometrial or colorectal carcinoma, and microsatellite instability testing is the laboratory method used for screening patients at the University of

Washington Medical Centers.

• POST PROCEDURE DIAG MAMMOGRAPHY LEFT - Edited Result - FINAL (07/22/2026 2:58 PM PDT)

Anatomical Region Laterality Modality

Breast Left Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Addenda

Addendum on 07/28/2026 4:42 PM PDT
Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:
Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.

• PATHOLOGY, SURGICAL - Edited Result - FINAL (07/22/2026 1:10 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, HER2, and Ki67 testing. See Biomarker Summary template below.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

Addenda

Addendum on 07/23/2026 10:21 AM PDT
ADDENDUM:

Epic is an electronic system that healthcare organizations like UW Medicine and Fred Hutch Cancer Center use to manage patient care records. Epic experienced a technical issue that resulted in some notes by care team members not saving in some patients' charts.

Care team members are rapidly evaluating potentially affected charts to ensure that all chart notes are accurate. During this evaluation, the following small update was made to your chart. This addition was minor; you do not need to take any follow-up action and your care plan is not impacted. Please feel free to reach out to your care team if you have questions.

On review the following modifications or additional findings/impression text are needed:

IUD has been removed.

I have personally reviewed the images and agree with the report (or as edited).

Impressions

07/21/2026 1:37 PM PDT

* Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm.
  * No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes.
  * Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
  * Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease.
  * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes.
* Moderately avid right axillary lymph node, concerning for metastatic.
  * Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast. Additional differential diagnosis include multiple myeloma, and lung adenocarcinoma.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/21/2026 1:37 PM PDT

This result has an attachment that is not available.

EXAMINATION:
PET MR F-18 FDG MID BODY

CLINICAL INDICATION:
cancer of unknown primary , metatatic to bone, assess for primary.
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Diagnostic mammogram from 7/15/2026 depicts BI-RADS 4 suspicious lesion in bilateral breasts. CEA is elevated at 28.6 ng/mL.

Imaging requested for diagnosis.

Initial treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,9.89 millicurie Intravenous,07/21/2026 0757
Injection site: Right antecubital fossa

TECHNIQUE:
Extent: Skull vertex to proximal thighs.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 100 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold MR images (3D T1 Dixon, axial T2) were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
CT chest, abdomen and pelvis 07/13/2026, mammography dated 07/15/2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.1
Mediastinal blood pool maximum SUV: 1.3
Liver mean SUV: 1.6.

Head and neck:
* Unremarkable.

Chest:
* Mild-to-moderate tracer uptake involving left lateral breast lesion measuring approximately 3.3 x 2.4 cm, with max SUV of 1.9 (9/277, 12/207).
* No focal uptake above the right breast background.
* Subcentimeter left axillary lymph nodes with faint FDG uptake. Non specific.
* Moderately avid right axillary lymph node measuring 9 x 8 mm, with max SUV of 2.0 (9/290, 12/188).

Abdomen and Pelvis:
* Linear FDG uptake in the rectum that limits the evaluation for focal lesions. However not clear focal

Osseous structures:
Innumerable foci of intense FDG uptake in the axial and appendicular skeleton involving left condylar process of mandible, bilateral ribs, bilateral clavicles, left humerus, sternum, sacrum, bilateral pelvic bones, and bilateral femurs and multiple vertebral levels, with compression fractures of T4, T8 and L5 vertebrae. A few representative lesions are as follows:
* Right lamina of T5 vertebra, with max SUV of 9.7 (9/302, 2/171).
* Medial end of right clavicle, with max SUV of 9.7 (9/306, 2/166).
* Right iliac bone with max SUV of 11.3 (9/158, 12/373)
* Left posterolateral ninth rib with max SUV of 7.3, with associated soft tissue component (9/260, 12/230).

Extremities:
* Unremarkable.

Additional noncontrast MRI findings:
* Indeterminate right maxillary sinus T1 and T2 hyperintense lesion, without tracer uptake, likely representing a polyp or mucous retention cyst with proteinaceous contents.
* Dental amalgam is seen, with resultant artifacts.
* IUD in place.
* Small nabothian cysts seen.
* Small volume pelvic ascites, likely physiologic.

* Dental amalgam is seen, with resultant artifacts.
* IUD in place.
* Small nabothian cysts seen.
* Small volume pelvic ascites, likely physiologic.

IMPRESSION

* Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm.
  * No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes.
  * Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
  * Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease.
  * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic disease is atypical for a breast primary, and an alternative primary malignancy should be considered.
* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes.
* Moderately avid right axillary lymph node, concerning for metastatic.
  * Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast. Additional differential diagnosis include multiple myeloma, and lung adenocarcinoma.

• (ABNORMAL) MAM MAMMOGRAPHY DIAG W/TOMO BILAT (MAMMOGRAPHY DIAG W/TOMO BILATERAL) - Final result (07/15/2026 9:50 AM PDT)

Anatomical Region Laterality Modality

Breast Bilateral Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

07/15/2026 10:38 AM PDT

This result has an attachment that is not available.

Table formatting from the original result was not included.

Examination:
A targeted bilateral breast ultrasound was performed.
A digital diagnostic mammogram of both breasts was performed.
Tomosynthesis images were also obtained and reviewed as part of this examination. The results and recommendations of today's exam were discussed with the patient. The patient will also receive written notification of the results and recommendations from today's exam.

Reason for Exam:
47 year old with reason for exam of lytic bone lesions that are suspicious for mets with unknown primary.

Examinations Available for Comparison:
Comparison is made to images from: 04/10/2025 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, 12/29/2021 Ultrasound Breast Limited Bilateral - Imaging Storage, 12/29/2021 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, and 10/03/2020 Mammography Screening w/Tomo Bilateral - Imaging Storage

Density:
The breasts are extremely dense, which lowers the sensitivity of mammography.

Breast Cancer Risk Score
5-Year Risk Lifetime Risk to age 85 Notes

TC8 - Extremely Dense: 1.55%

TC8 - Extremely Dense: 13.59%

This is compared to risks for a woman of the same age:

5-year risk: TC8 - Extremely Dense: 1.13%
Lifetime risk: TC8 - Extremely Dense: 9.97%
Lifetime risk categories: Average risk <15%, Intermediate risk 15-25%, High risk >25%

For women with high (>25%) lifetime risk estimates, consider referral for further risk assessment and discussion of supplemental screening. Breast cancer risk consultation is available at Fred Hutchinson Cancer Center 206-606-2166 or at UWMC-Roosevelt 206-598-7749 or at UWMC-NW 206-668-6746.

Findings:
Left
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the left breast.

Mass
Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass
Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node
Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst
Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the

lower inner quadrant of the right breast, middle depth.
Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node
Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:
Left
1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right
1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:
Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

• (ABNORMAL) Focused Breast Ultrasound Both Breasts (US BREAST LIMITED BILATERAL) - Final result (07/15/2026 9:03 AM PDT)

Anatomical Region Laterality Modality

Breast Bilateral Ultrasound

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

07/15/2026 10:38 AM PDT

This result has an attachment that is not available.

Table formatting from the original result was not included.
Examination:
A targeted bilateral breast ultrasound was performed.
A digital diagnostic mammogram of both breasts was performed.
Tomosynthesis images were also obtained and reviewed as part of this examination. The results and recommendations of today's exam were discussed with the patient. The patient will also receive written notification of the results and recommendations from today's exam.

Reason for Exam:
47 year old with reason for exam of lytic bone lesions that are suspicious for mets with unknown primary.

Examinations Available for Comparison:
Comparison is made to images from: 04/10/2025 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, 12/29/2021 Ultrasound Breast Limited Bilateral - Imaging Storage, 12/29/2021 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, and 10/03/2020 Mammography Screening w/Tomo Bilateral - Imaging Storage

Density:
The breasts are extremely dense, which lowers the sensitivity of mammography.

Breast Cancer Risk Score
5-Year Risk Lifetime Risk to age 85 Notes

TC8 - Extremely Dense: 1.55%

TC8 - Extremely Dense: 13.59%

This is compared to risks for a woman of the same age:

5-year risk: TC8 - Extremely Dense: 1.13%
Lifetime risk: TC8 - Extremely Dense: 9.97%
Lifetime risk categories: Average risk <15%, Intermediate risk 15-25%, High risk >25%

For women with high (>25%) lifetime risk estimates, consider referral for further risk assessment and discussion of supplemental screening. Breast cancer risk consultation is available at Fred Hutchinson Cancer Center 206-606-2166 or at UWMC-Roosevelt 206-598-7749 or at UWMC-NW 206-668-6746.

Findings:
Left
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the left breast.

Mass
Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm

irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass

Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node

Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right

Post-Surgical Finding

Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst

Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the lower inner quadrant of the right breast, middle depth.
Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node

Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:

Left

1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock.
Assessment: 2 - Benign finding.

Right
1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes.
Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:
Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

• CT Chest with Contrast (CT CHEST W CONTRAST) - Final result (07/13/2026 10:36 AM PDT)

Anatomical Region Laterality Modality

Chest Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/13/2026 1:58 PM PDT

Impressions

07/13/2026 2:20 PM PDT

* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

Narrative

07/13/2026 2:20 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT CHEST W CONTRAST

CLINICAL INDICATION:
Lytic bone lesions on xray

TECHNIQUE:
CTB C1 CT Chest with intravenous contrast.
Computed tomography was obtained through the chest with intravenous contrast.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/13/2026 1036

COMPARISON:
None.

FINDINGS:
Supraclavicular region: Unremarkable.

Mediastinum: Unremarkable.

Heart and great vessels: Unremarkable.

Lungs: A few scattered nodules are noted, measuring up to 4 mm (for example 5/163).

Pleura: Unremarkable.

Chest wall: Unremarkable.

Upper abdomen: Unremarkable.

Bones:
* Multiple lytic lesions are noted, most prominently visible throughout the spine, particularly T4, T5, and T8 vertebral bodies, and also noted within the sternum and the ribs. Some lesions are expansile, the largest of which is in the left ninth rib (5/164), demonstrating a soft tissue component that measures approximately 27 x 16 mm (3/217).
* Fracture of the left 11th rib (5/207).

Impressions

07/13/2026 3:59 PM PDT

Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/13/2026 3:59 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT ABDOMEN AND PELVIS W CONTRAST

CLINICAL INDICATION:
Lytic bone lesions on xray.
Pathological fracture, other site, initial encounter for fracture

TECHNIQUE:

CTB A2 CT Abdomen pelvis with intravenous contrast.
Computed tomography was obtained through the abdomen and pelvis with intravenous contrast only. Multiplanar reformatted images were performed.

CONTRAST:

IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/13/2026 1036

COMPARISON:

None.

FINDINGS:

Lower chest: Dictated separately.
Liver: Unremarkable with no suspicious focal lesion.
Gallbladder: Unremarkable.
Bile ducts: Unremarkable.
Spleen: Unremarkable.
Pancreas: No suspicious mass or duct dilation.
Adrenal glands: Unremarkable.
Kidneys and Ureters: Unremarkable.
Lymph Nodes: No enlarged lymph nodes.
Vasculature: Unremarkable.
Bowel: No obstruction or inflammatory bowel changes.
Reproductive organs: IUD in the uterus. Bilateral ovarian cysts, largest on the left measuring 2.1 x 1.6 cm.
Bladder: Unremarkable.
Peritoneum: Trace free fluid, likely physiologic.
Abdominal wall: Unremarkable
Bones: Multiple lytic lesions throughout the thoracolumbar spine and sacrum as well as the bilateral iliac bones.

• CT Chest with Contrast (CT CHEST W CONTRAST) - Final result (07/13/2026 10:36 AM PDT)

Anatomical Region Laterality Modality

Chest Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/13/2026 1:58 PM PDT

Impressions

07/13/2026 2:20 PM PDT

* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

Narrative

07/13/2026 2:20 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT CHEST W CONTRAST

CLINICAL INDICATION:
Lytic bone lesions on xray

TECHNIQUE:
CTB C1 CT Chest with intravenous contrast.
Computed tomography was obtained through the chest with intravenous contrast.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/13/2026 1036

COMPARISON:
None.

FINDINGS:
Supraclavicular region: Unremarkable.

Mediastinum: Unremarkable.

Heart and great vessels: Unremarkable.

Lungs: A few scattered nodules are noted, measuring up to 4 mm (for example 5/163).

Pleura: Unremarkable.

Chest wall: Unremarkable.

Upper abdomen: Unremarkable.

Bones:
* Multiple lytic lesions are noted, most prominently visible throughout the spine, particularly T4, T5, and T8 vertebral bodies, and also noted within the sternum and the ribs. Some lesions are expansile, the largest of which is in the left ninth rib (5/164), demonstrating a soft tissue component that measures approximately 27 x 16 mm (3/217).
* Fracture of the left 11th rib (5/207).

Miscellaneous Notes

Telephone Encounter - Shalece C - 07/13/2026 4:00 PM PDT

Formatting of this note might be different from the original.
Shalece Christensen, RN of FHCC Nurse Navigation contacted patient by phone to provide education and care coordination. Patient was referred by PCP for FHCC.

Narrative of diagnosis/ reason for care/ goals of care: Patient reports in mid-February she started to have back pain, felt like she couldn't take a deep breath. Saw PCP, x-rays fine. Pain persisted, sent to musculoskeletal specialist who thought maybe pt had muscle strain. X-rays fine, MRI abnormal. Four or five fractures on vertebra as well as lesions on vertebra, likely cancer that has been spreading. Radiologist thinks primary source is elsewhere, referred to FHCC for evaluation

Upcoming/pending appointments: IUD removal tomorrow 7/14

Assessment:
Swollen Lymph Nodes/palpable lump (location): No
Unexplained weight loss (note amount and timeframe): No
Fatigue (0-10): yes, sleeping poorly
Nausea/Vomiting: No
Fever or night sweats: No
Skin concerns (itching, rash, new lesions): No
Pain (location/rating): stiffness/pain in upper back 5-7/10- taking ibuprofen and tylenol for the last 5 months

Respiratory symptoms (cough, SOB): Can't take full breath
Other symptoms of concern reported by patient: has IUD with period every three weeks, spotting with brown discharge; has had current bleeding for 21 days straight

Oncologic History:

Oncology History Overview

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

Results

- (ABNORMAL) MAM MAMMOGRAPHY DIAG W/TOMO BILAT (MAMMOGRAPHY DIAG W/TOMO BILATERAL) - Final result (07/15/2026 9:50 AM PDT)

Anatomical Region Laterality Modality

Breast Bilateral Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

07/15/2026 10:38 AM PDT

This result has an attachment that is not available.

Table formatting from the original result was not included.

Examination:
A targeted bilateral breast ultrasound was performed.
A digital diagnostic mammogram of both breasts was performed.
Tomosynthesis images were also obtained and reviewed as part of this examination. The results and recommendations of today's exam were discussed with the patient. The patient will also receive written notification of the results and recommendations from today's exam.

Reason for Exam:
47 year old with reason for exam of lytic bone lesions that are suspicious for mets with unknown primary.

Examinations Available for Comparison:
Comparison is made to images from: 04/10/2025 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, 12/29/2021 Ultrasound Breast Limited Bilateral - Imaging Storage, 12/29/2021 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, and 10/03/2020 Mammography Screening w/Tomo Bilateral - Imaging Storage

Density:
The breasts are extremely dense, which lowers the sensitivity of mammography.

Breast Cancer Risk Score
5-Year Risk Lifetime Risk to age 85 Notes

TC8 - Extremely Dense: 1.55%

TC8 - Extremely Dense: 13.59%

This is compared to risks for a woman of the same age:

5-year risk: TC8 - Extremely Dense: 1.13%
Lifetime risk: TC8 - Extremely Dense: 9.97%
Lifetime risk categories: Average risk <15%, Intermediate risk 15-25%, High risk >25%

For women with high (>25%) lifetime risk estimates, consider referral for further risk assessment and discussion of supplemental screening. Breast cancer risk consultation is available at Fred Hutchinson Cancer Center 206-606-2166 or at UWMC-Roosevelt 206-598-7749 or at UWMC-NW 206-668-6746.

Findings:
Left
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the left breast.

Mass
Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass
Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node
Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst

Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the lower inner quadrant of the right breast, middle depth.
Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node

Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:

Left

1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right

1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:

Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

Results

- (ABNORMAL) MAM MAMMOGRAPHY DIAG W/TOMO BILAT (MAMMOGRAPHY DIAG W/TOMO BILATERAL) - Final result (07/15/2026 9:50 AM PDT)

Anatomical Region Laterality Modality

Breast Bilateral Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Narrative

07/15/2026 10:38 AM PDT

This result has an attachment that is not available.

Table formatting from the original result was not included.

Examination:
A targeted bilateral breast ultrasound was performed.
A digital diagnostic mammogram of both breasts was performed.
Tomosynthesis images were also obtained and reviewed as part of this examination. The results and recommendations of today's exam were discussed with the patient. The patient will also receive written notification of the results and recommendations from today's exam.

Reason for Exam:
47 year old with reason for exam of lytic bone lesions that are suspicious for mets with unknown primary.

Examinations Available for Comparison:
Comparison is made to images from: 04/10/2025 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, 12/29/2021 Ultrasound Breast Limited Bilateral - Imaging Storage, 12/29/2021 Mammography Diagnostic with Tomo Bilateral - Imaging Storage, and 10/03/2020 Mammography Screening w/Tomo Bilateral - Imaging Storage

Density:
The breasts are extremely dense, which lowers the sensitivity of mammography.

Breast Cancer Risk Score
5-Year Risk Lifetime Risk to age 85 Notes

TC8 - Extremely Dense: 1.55%

TC8 - Extremely Dense: 13.59%

This is compared to risks for a woman of the same age:

5-year risk: TC8 - Extremely Dense: 1.13%
Lifetime risk: TC8 - Extremely Dense: 9.97%
Lifetime risk categories: Average risk <15%, Intermediate risk 15-25%, High risk >25%

For women with high (>25%) lifetime risk estimates, consider referral for further risk assessment and discussion of supplemental screening. Breast cancer risk consultation is available at Fred Hutchinson Cancer Center 206-606-2166 or at UWMC-Roosevelt 206-598-7749 or at UWMC-NW 206-668-6746.

Findings:
Left
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the left breast.

Mass
Ultrasound Breast Limited Bilateral: There is a 9 mm x 7 mm x 11 mm irregularly shaped, hypoechoic mass with indistinct margins in the left breast at 1 o'clock, 7 cm from the nipple. There is ill-defined heterogeneous tissue seen medial to this mass.

Mass
Mammography Diagnostic with Tomo Bilateral: There is a 7 mm equal density, oval mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a 7 mm x 4 mm x 7 mm oval, parallel-oriented, hypoechoic mass with circumscribed margins in the left breast at 2 o'clock. The mass correlates with the mass seen on the mammogram.

Lymph Node
Mammography Diagnostic with Tomo Bilateral: There is a 9 mm partially imaged mass with circumscribed margins in the upper outer quadrant of the left breast, posterior depth.
Ultrasound Breast Limited Bilateral: There is a normal-appearing intramammary lymph node in the left breast at 2 o'clock, 6 cm from the nipple. The lymph node correlates with the mass seen on the mammogram.

Right
Post-Surgical Finding
Mammography Diagnostic with Tomo Bilateral: There are post-surgical findings from a breast reduction in the right breast.

Cyst

Mammography Diagnostic with Tomo Bilateral: There is a 10 mm low density, oval mass with circumscribed margins and layering calcifications in the lower inner quadrant of the right breast, middle depth.
Ultrasound Breast Limited Bilateral: There is a 13 mm x 8 mm x 15 mm simple cyst in the right breast at 5 o'clock, 6 cm from the nipple. The cyst correlates with the mass seen on the mammogram.

Lymph Node

Ultrasound Breast Limited Bilateral: There are at least three morphologically abnormal right axillary lymph node with cortical thickening, correlating with findings seen on 7/13/2026 CT chest.

Impression:

Left

1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.

3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right

1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.

2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:

Left Assessment BI-RADS: 4 - Suspicious
Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

The patient is noted to have dense breasts and received or will receive information regarding breast density in accordance with the Mammography Quality Standards Act. Dense breasts are normal and common, present in approximately half of women screened at the UW/Fred Hutch. Please see above for risk assessment information, if applicable.

Progress Notes

Keith D Eaton - 07/15/2026 4:15 PM PDT

Formatting of this note might be different from the original.

IDENTIFICATION
Yvonne K Franklin is a 47 year old female here today for oncology consultation for cancer of unknown primary with diffuse lytic bone lesions and pathologic vertebral fractures.

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? No, not used. Not discussed this visit.
?

ECOG
1 (Restricted in physically strenuous activity but ambulatory and able to carry out work of a light or sedentary nature, e.g., light house work, office work)

History of Present Illness:
47-year-old woman referred for urgent oncology evaluation after imaging demonstrated multifocal lytic osseous lesions and pathologic thoracic compression fractures concerning for metastatic malignancy of unknown primary origin.

Patient reports onset of thoracic back pain in February 2026. It initially started on her upper back by her right scapula but later would migrate to other parts of her back. She had a fall while skiing as well, but the fall event was not in congruent with her back pain. The pain was worsened with sneezing, twisting, lifting, deep inspiration, and turning in bed. Symptoms progressively worsened over several months despite PT exercises, stretching, massage, topical therapies, NSAIDs, gabapentin, muscle relaxants, and trigger point treatment. She subsequently developed left rib pain and difficulty taking a full deep breath.

Thoracic spine MRI obtained 7/1/26 demonstrated diffuse abnormal marrow signal with multiple expansile vertebral lesions involving T1, T5, T8-T10, compression deformities at T1/T4/T5/T8 concerning for pathologic fractures, and possible liver lesion. CT chest/abdomen/pelvis on 7/13/26 showed diffuse lytic lesions throughout spine and pelvis, left 11th rib fracture, and scattered pulmonary nodules up to 4 mm without clear primary malignancy identified.

Currently reports persistent upper thoracic pain/stiffness rated 5-7/10. Taking ibuprofen and acetaminophen regularly for approximately 5 months. Unable to tolerate Percocet previously. Reports fatigue and poor sleep

related to pain and anxiety surrounding diagnosis. Appetite generally intact though decreased interest in eating due to stress. Denies unexplained weight loss, fevers, night sweats, nausea, vomiting, palpable lymphadenopathy, or skin changes.

Of note, she reports also reports abnormal uterine bleeding with Mirena IUD in place. She had her Mirena replaced in 8/2025, and since then she has been experiencing cycles occurring every 3 weeks with prolonged bleeding and brown discharge; current bleeding ongoing for approximately 21 days. IUD was removed on 7/14/26, and she continues to have bleeding today. She uses about 3 pads per day and reports the bleeding is not heavy but more than spotting. Prior FSH elevated at 30.2. CT A/P noted small bilateral ovarian cysts.

Past Medical History:
Generalized anxiety disorder
Migraine headaches
Mild intermittent asthma
IBS with diarrhea
Eosinophilic esophagitis
GERD
PVCs/supraventricular bigeminy

Cervical degenerative disc disease
Menorrhagia
Vitamin D deficiency
Gilbert syndrome
Herpes simplex

Past Surgical History:
Breast reduction
Wisdom tooth extraction

Social History:
Lives in Kirkland, WA with husband and two children ages 9 and 11. Never smoker. No current alcohol use.

MEDICATIONS
Current Medications

Albuterol inhaler PRN
Propranolol 10 mg daily
Citalopram 20 mg daily
Alprazolam PRN at nighttime for sleep
Cyclobenzaprine PRN - not taking
Sumatriptan PRN
Omeprazole 20 mg daily
Valacyclovir PRN

Dicyclomine PRN
Mirena IUD - removed yesterday
Loestrin FE - not taking
OTC ibuprofen and acetaminophen

Allergies:
Fentanyl (PVCs)
Propofol (PVCs)

Family History:
Maternal grandmother with colon cancer

Physical Exam
BP (!) 158/83 | Pulse (!) 102 | Temp 36.8 °C (Oral) | Resp 16 | SpO2 98%

GENERAL: Breathing comfortably on room air.
Psychiatric: The patient has a normal affect.

LABORATORY
CBC and CMP are remarkable for CO2 31, BUN 21
CEA 29 or 23 depending on assay.
CA125 28 normal

DIAGNOSTIC STUDIES
CT CAP 7/13/26
Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
Fracture of the left 11th rib.
A few scattered nodules, measuring up to 4 mm.
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/1/26: MRI T Spine
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

Breast Mammo/UW, see report from today
Left
1) Status post breast reduction. Left breast 9 mm x 7 mm x 11 mm mass at 1 o'clock with ill-defined heterogeneous tissue seen more medially. There is no definite mammographic correlate. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.
2) Left breast 7 mm x 4 mm x 7 mm oval circumscribed mass at 2 o'clock. Assessment: 3 - Probably benign. Management is deferred pending biopsy results.
3) Left breast normal-appearing intramammary lymph node at 2 o'clock. Assessment: 2 - Benign finding.

Right
1) Status post breast reduction. Right breast 13 mm x 8 mm x 15 mm simple cyst at 5 o'clock. Assessment: 2 - Benign finding.
2) At least three morphologically abnormal right axillary lymph nodes. Assessment: 4 - Suspicious finding. Ultrasound Guided Core Biopsy is recommended. The patient was given information about this procedure and the scheduling team was notified to call the patient to schedule.

Overall:
Left Assessment BI-RADS: 4 - Suspicious

Right Assessment BI-RADS: 4 - Suspicious
Overall Assessment BI-RADS: 4 - Suspicious

ASSESSMENT AND PLAN
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Differential includes metastatic solid tumor, hematologic malignancy including multiple myeloma/lymphoma, or less likely primary bone process
.
Also with chronic abnormal uterine bleeding and bilateral ovarian cysts requiring gynecologic follow-up, though no definitive gynecologic primary identified on CT imaging.

Based on imaging findings and elevated CEA, breast cancer is a leading diagnosis.
Breast biopsy scheduled for next week
Bone biopsy ordered.
PET MR ordered to assess for primary/extent of bony disease

Follow-up with gynecology regarding abnormal uterine bleeding. No hormones until cancer diagnosis established. IUD has been removed.

Pain management - patient will use current opioid and report back.
I will prescribe based on use.

Miralax, senna and MOM for constipation

Anxiety support and symptom management ongoing through PCP and oncology team

Orders Placed This Encounter

- PET MR F-18 FDG Mid Body
- Biopsy Consult - IR/Radiology

I saw the patient with fellow Anh Lam.

Current Outpatient Medications:

- acetaminophen-codeine 300-30 MG tablet, Take 1 tablet by mouth every 6 hours as needed., Disp: , Rfl:
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:

Addenda

Addendum on 07/23/2026 10:21 AM PDT
ADDENDUM:

Epic is an electronic system that healthcare organizations like UW Medicine and Fred Hutch Cancer Center use to manage patient care records. Epic experienced a technical issue that resulted in some notes by care team members not saving in some patients' charts.

Care team members are rapidly evaluating potentially affected charts to ensure that all chart notes are accurate. During this evaluation, the following small update was made to your chart. This addition was minor; you do not need to take any follow-up action and your care plan is not impacted. Please feel free to reach out to your care team if you have questions.

On review the following modifications or additional findings/impression text are needed:

IUD has been removed.

I have personally reviewed the images and agree with the report (or as edited).

Impressions

07/21/2026 1:37 PM PDT

* Mild to moderately FDG-avid lesion in the left lateral breast, concerning for a primary breast neoplasm.
  * No left axillary lymphadenopathy or abnormal FDG uptake within the left axillary lymph nodes.
  * Moderately FDG-avid right axillary lymph node, suspicious for metastatic involvement.
  * Innumerable markedly intense FDG-avid osseous lesions throughout the axial and appendicular skeleton, with associated compression fractures involving several vertebral bodies, consistent with widespread metastatic disease.
  * Given the markedly greater extent and intensity of skeletal FDG uptake relative to the left breast lesion, along with the absence of ipsilateral axillary nodal involvement, the pattern of metastatic disease is atypical for a breast primary, and an alternative primary malignancy should be considered.

* Mild to moderately avid left lateral breast lesion, possible neoplastic involvement. No left axillary lymphadenopathy or abnormal FDG uptake within the lymph nodes.

* Moderately avid right axillary lymph node, concerning for metastatic.
  * Innumerable foci of intense FDG uptake involving axial and appendicular skeleton, with compression fractures of few vertebrae, likely metastatic. The intensity of the FDG uptake in the bone metastatic disease in comparison to the breast lesion and negative left lymph node involvement make it less likely to be originaria from the breast. Additional differential diagnosis include multiple myeloma, and lung adenocarcinoma.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/21/2026 1:37 PM PDT

This result has an attachment that is not available.

EXAMINATION:
PET MR F-18 FDG MID BODY

CLINICAL INDICATION:
cancer of unknown primary , metatatic to bone, assess for primary.
47-year-old woman with diffuse lytic osseous lesions involving thoracic spine and pelvis with multiple pathologic vertebral compression fractures and rib fracture, highly concerning for metastatic malignancy of unknown primary. No clear primary identified on CT chest/abdomen/pelvis. Diagnostic mammogram from 7/15/2026 depicts BI-RADS 4 suspicious lesion in bilateral breasts. CEA is elevated at 28.6 ng/mL.

Imaging requested for diagnosis.

Initial treatment strategy.

RADIOPHARMACEUTICAL:
FLUORODEOXYGLUCOSE F-18 FDG UWM UWM INJECTION,9.89 millicurie Intravenous,07/21/2026 0757
Injection site: Right antecubital fossa

TECHNIQUE:
Extent: Skull vertex to proximal thighs.
Uptake time: 60 minutes.
Fasting blood glucose level prior to FDG injection: 100 mg/dL.

After radiopharmaceutical injection, nondiagnostic, noncontrast, nonbreathhold MR images (3D T1 Dixon, axial T2) were obtained for attenuation correction and fusion with emission PET images for anatomical localization.

Images were interpreted on Visage PACS.

COMPARISON:
CT chest, abdomen and pelvis 07/13/2026, mammography dated 07/15/2026

FINDINGS:
Mediastinal blood pool mean SUV: 1.1
Mediastinal blood pool maximum SUV: 1.3
Liver mean SUV: 1.6.

Head and neck:
* Unremarkable.

Chest:
* Mild-to-moderate tracer uptake involving left lateral breast lesion measuring approximately 3.3 x 2.4 cm, with max SUV of 1.9 (9/277, 12/207).
* No focal uptake above the right breast background.
* Subcentimeter left axillary lymph nodes with faint FDG uptake. Non specific.
* Moderately avid right axillary lymph node measuring 9 x 8 mm, with max SUV of 2.0 (9/290, 12/188).

Abdomen and Pelvis:
* Linear FDG uptake in the rectum that limits the evaluation for focal lesions. However not clear focal

Osseous structures:
Innumerable foci of intense FDG uptake in the axial and appendicular skeleton involving left condylar process of mandible, bilateral ribs, bilateral clavicles, left humerus, sternum, sacrum, bilateral pelvic bones, and bilateral femurs and multiple vertebral levels, with compression fractures of T4, T8 and L5 vertebrae. A few representative lesions are as follows:
* Right lamina of T5 vertebra, with max SUV of 9.7 (9/302, 2/171).
* Medial end of right clavicle, with max SUV of 9.7 (9/306, 2/166).

* Right iliac bone with max SUV of 11.3 (9/158, 12/373)
* Left posterolateral ninth rib with max SUV of 7.3, with associated soft tissue component (9/260, 12/230).

Extremities:
* Unremarkable.

Additional noncontrast MRI findings:
* Indeterminate right maxillary sinus T1 and T2 hyperintense lesion, without tracer uptake, likely representing a polyp or mucous retention cyst with proteinaceous contents.
* Dental amalgam is seen, with resultant artifacts.
* IUD in place.
* Small nabothian cysts seen.
* Small volume pelvic ascites, likely physiologic.

Results

• POST PROCEDURE DIAG MAMMOGRAPHY LEFT - Edited Result - FINAL (07/22/2026 2:58 PM PDT)

Anatomical Region Laterality Modality

Breast Left Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Addenda

Addendum on 07/28/2026 4:42 PM PDT

Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:

Ultrasound Guided Breast Biopsy Left

Post Procedure Diagnostic Mammography Left

The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:

The patient's left breast was imaged and images of the mass in the upper

outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.

Breast Right Ultrasound

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Addenda

Addendum on 07/28/2026 4:42 PM PDT
Pathology results reveal axillary node with metastatic carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/2026 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:
Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was

prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Right Ultrasound Guided Axillary Lymph Node Biopsy complete.

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, HER2, and Ki67 testing. See Biomarker Summary template below.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY Addendum electronically signed by Dintzis, Suzanne Martha, MD on 7/28/2026 at 1054 PDT

Final Diagnosis A) Left breast, 1:00 7 cm FN, core biopsy:
- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:
- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Results

• POST PROCEDURE DIAG MAMMOGRAPHY LEFT - Edited Result - FINAL (07/22/2026 2:58 PM PDT)

Anatomical Region Laterality Modality

Breast Left Mammography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

Addenda

Addendum on 07/28/2026 4:42 PM PDT

Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.

Narrative

07/22/2026 4:11 PM PDT

This result has an attachment that is not available.

Examination:

Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:

The patient's left breast was imaged and images of the mass in the upper

outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, HER2, and Ki67 testing. See Biomarker Summary template below.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

Final Diagnosis A) Left breast, 1:00 7 cm FN, core biopsy:
- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:
- Metastatic carcinoma, See Comment.

COMMENT:

B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Slides Test Result
A1-4 E-Cadherin (EP700Y) NEGATIVE: Supports lobular phenotype.

All controls show appropriate reactivity. 07/28/2026 10:54 AM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY

Gross Description A. Breast Left, biopsy needle core.
Received in formalin labeled, "Franklin, Yvonne; Left Breast mass 1:00 7cmfn" are 4 tan-yellow to hemorrhagic cores of fibrofatty tissue, 1.8 x 0.7 x 0.2 cm in aggregate. Inked blue, wrapped, and entirely submitted in A1. Total fixation time: Approximately 28 hours.

B. Lymph node, biopsy.
Received in formalin labeled "Franklin, Yvonne; Right Axilla LN" are 2 yellow-white to hemorrhagic, fibrofatty soft tissue cores. Stained, wrapped, and entirely submitted in B1-B2. Total fixation time: Approximately 28 hours. (LS)

Fred Hutch Cancer Center / UW Medicine
Radiation Oncology New Patient Visit

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: on the road after her breast biopsy with her husband driving
Present with patient: Family member

Patient Care Team:
Purcell, William Thomas, MD as Oncologist (Hematology-Oncology)

PCP: Paras, Leilani D, MD

Referrer: Keith David Eaton

Patient summary
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26 pending bone biopsy 7/24/26. She presents for discussion of radiotherapy.

Oncology History Overview Note

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0.
Innumerable bony foci including compression fractures of T4, T8, L5.
[image]

No problem history exists.

Pain
Pain Score: 5 - Moderate (7/15/2026 4:08 PM)

Safety and Mobility
Have you fallen in the past year?: No (7/15/2026 4:08 PM)

Interval history

Today, Ms. Franklin presents with her husband on Zoom.

She reports a sharp pain over Rt buttock when putting pressure on Rt foot including walking, going to sit down, turning side to side. The pain shoot ups a little bit above buttock up back but largely localized. She is using oxycodone 5mg tab q4h with partial relief.

Wt Readings from Last 9 Encounters:

07/21/26 55.7 kg (122 lb 12.7 oz)

07/15/26 56.7 kg (125 lb)

Imaging and pathology
Reviewed in HPI

Ultrasound Guided Axillary Lymph Node Biopsy Right
Examination:
Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Right Ultrasound Guided Axillary Lymph Node Biopsy complete.
US Guided Breast Biopsy Left, Post Procedure Diagnostic Mammography Left
Examination:

Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding,

pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.

Assessment
Yvonne K Franklin is a 47 year old with cancer of unknown primary, possibly Lt breast s/p biopsy Lt breast and Rt axilla 7/22/26 with pending bone biopsy 7/24/26.

We discussed the rationale for and the specifics of treatment.

Given her initial diagnosis and diffuse bony disease, pinpointing the area of pain may be difficult. I suspect her pain could be from Rt ilium, Rt sacum, or L5 compression fracture. During CT-sim, we will place BBs over the location(s) of her pain to help us target.

I plan to treat with 3D conformal technique. Pain relief is equivalent between single fraction vs. multifractionated regimen. The main advantage of multifractionated regimen is a decrease in need for retreatment (about 10 vs 20% at 6 months). About 15% of patients have a complete pain response and 50% have a partial pain response (total of 65% have pain response)

I am thinking of a single fraction of 8 Gy x1 due to low confidence of being able to pinpoint a focus.

If during CT-sim, I am more confident, I may increase dose to 20 Gy/5 fx.

I discussed we would wait for pathology to return a diagnosis of cancer before starting radiation. Some hematologic cancers can respond just as quickly to systemic therapy.

Plan
We discussed in detail the potential risks, benefits, side effects, and alternatives to radiation therapy. Side effects include but are not limited to:
Acute: fatigue, pain flare, nauseas, runny stools
Late: secondary malignancy (>10 years out)

All questions were addressed. The patient agrees with the recommended plan.

-bone biopsy 7/24/26
-CT-simulation already scheduled for Monday 7/27/26
-if pathology results in cancer, plan for either 8 Gy x1 if unsure about target or a higher dose such as 20 Gy/5 fx if physical exam suggests a clearer etiology for her pain.

I spent a total of 60 minutes for the patient's care on the date of the service independent from other healthcare team members. This time encompasses review of records, personal review of imaging, face-to-face discussion with patient, placing orders/referrals, care coordination, and documentation. I provided longitudinal care for complex and serious medical problems.

Past Medical History:

Diagnosis Date

- Breast cyst Always

Current Outpatient Medications:

- oxyCODONE 5 MG tablet, Take 1-2 tablets by mouth every 4 hours as needed for moderate pain., Disp: 100 tablet, Rfl: 0
- propranolol 10 MG tablet, Take 1 tablet by mouth daily., Disp: , Rfl:

Progress Notes

Julia Anne B Suico - 07/22/2026 10:00 AM PDT

Formatting of this note might be different from the original.
Mid-back pain below the shoulder blade since February
Now entire back, upper back is constant and tight, and sharp pain at the lower right side. This week that is feeling worse.
Pain is worse when placing pressure on the RLE, sitting, laying, bending, and any movements.
This affect her gait as she compensates with her LLE.
Relief with avoiding triggers and oxycodone 10mg

BLE atrophy
Generalized weakness
Frail when up and about

PET SCAN

Electronically signed by Julia Anne B Suico at 07/22/2026 5:26 PM PDT

Anubhav Gautam Amin - 07/22/2026 10:00 AM PDT

Formatting of this note might be different from the original.
University of Washington Medical Center Neurosurgery
Provider: Anubhav Amin, MD
Visit Date: 7/22/2026

Distant Site Telemedicine Encounter
I conducted this encounter via secure, live, face-to-face video conference with the patient. I reviewed the risks and benefits of telemedicine as pertinent to this visit and the patient agreed to proceed.

Provider Location: On-site location (clinic, hospital, on-site office)
Patient Location: At home
Present with patient: Family member

Use of Ambient Listening:
Was ambient listening technology used during this visit and was verbal consent for recording obtained? Yes, used in visit. Consent was obtained.
?

HPI:
History of Present Illness
Yvonne K Franklin is a 47 year old female with multifocal vertebral lesions and reported pathologic vertebral compression fractures who presents for evaluation of progressive cancer-related back pain.

Back Pain:

- Mid-back pain below the shoulder blade began in 02/2026 and has progressively worsened to involve the entire back
- Upper back pain characterized by constant tightness; previously the most symptomatic area but now less intense than last week
- Pain limits activity; without medication, upper back pain is 6-7/10, improving to 1-2/10 with medication
- This week developed new sharp, localized right lower back pain, more disabling than upper back tightness
- Right lower back pain triggered by weight-bearing on the right leg and certain twisting motions; worsened by sitting, lying, bending, and most movement
- When triggered, pain is 9-10/10, improving to about 5/10 with medication and by removing pressure/avoiding provoking movements
- Pain has altered gait, with compensation by relying more on the left leg

Neuromuscular Symptoms:

- Generalized weakness
- Caregiver-noted lower extremity atrophy
- No numbness or tingling down the legs

Imaging and Oncologic Workup:

- Thoracic spine MRIs in 06/2026 and 07/01/2026 show multiple vertebral lesions with pathologic fractures at T1, T5, T7, and T8
- Possible liver lesion per caregiver
- Completed PET scan on 07/21/2026
- Medical oncology evaluation has included consideration of myeloma versus breast primary; blood work reportedly "really good"
- Awaiting tissue diagnosis with breast biopsy scheduled for 07/22/2026 and bone biopsy scheduled for Friday

IMAGING:

Results
Radiology
Thoracic spine MRI (07/01/2026): Multiple vertebral body lesions; marked osseous erosion at T8 with compression fracture; additional thoracic lesions; no spinal cord compression. (Independently interpreted)
Chest and lumbar spine CT (07/2026): Multiple vertebral body lesions in thoracic and lumbar spine; marked osseous erosion at T8 with compression fracture; additional lesions in lumbar region; no major fracture or gross malalignment. (Independently interpreted)

Whole body PET (07/21/2026): Multiple hypermetabolic lesions in vertebral bodies corresponding to osseous erosion; no intracranial involvement; no spinal cord compression. (Independently interpreted)

IMPRESSION / ASSESSMENT:

ICD-10-CM

1. Secondary malignant neoplasm of bone (HCC) C79.51 Referral to Interventional Radiology - Clinic

Assessment & Plan
Spinal osseous metastatic disease with pathologic vertebral compression fractures
Multifocal osseous metastatic disease in thoracic and lumbar spine with pathologic vertebral body erosion and compression fractures, notably at T8, without spinal cord compression or major malalignment. Primary malignancy under evaluation pending biopsy results.

- Urgent referral to Interventional Radiology for vertebroplasty/kyphoplasty for structural support at high-risk vertebral levels.
- Referral to Radiation Oncology for palliative, pain-targeted radiation therapy.
- Present case at weekly spine tumor board for multidisciplinary management and assessment of pain generators and fracture risk.
- Coordinate timing with Radiation Oncology and Interventional Radiology; prioritize radiation if scheduled imminently, followed by cement augmentation if feasible.
- Proceed with breast biopsy today and bone biopsy Friday; compare pathology to determine primary and guide systemic therapy/radiation sensitivity.
- Discuss biopsy consent options for mutation testing and sample preservation with Medical Oncology and biopsy team.

Cancer-related back pain
Severe, movement-exacerbated back pain due to multifocal spinal osseous metastatic disease and pathologic fractures, with persistent upper back pain and new sharp right lower back pain, without neurologic deficits.

- Radiation Oncology evaluation for palliative, pain-targeted radiation; consultation today, simulation/body setup scan Monday.
- Interventional Radiology evaluation for vertebroplasty/kyphoplasty to reduce pain and prevent further vertebral height loss; limit or stage levels treated to reduce procedural risk.
- Coordinate with Medical Oncology for systemic therapy planning post-biopsy results to control disease burden contributing to pain.
- Counseled on shifting pain possibly due to pain flare/inflammatory response or compression fracture settling; maintain close coordination during expedited diagnosis and treatment.

Prior EMR records reviewed as available and clinically relevant. All questions answered. Discharge and follow up instructions were discussed with the patient. The patient fully understands and is in agreement with the plan.

Number and Complexity of Problems Addressed
1 acute, uncomplicated illness or injury
1 undiagnosed new problem with uncertain prognosis
1 or more chronic illness with severe exacerbation, progression, or side effects of treatment
1 acute or chronic illness or injury that poses a threat to life or bodily function

Amount and/or Complexity of Data to be Reviewed and Analyzed
Independent interpretation of a test performed by another physician/other qualified health care professional (not separately reported)

Risk of Complications and/or Morbidity or Mortality of Patient Management
Moderate

Portions of this chart were made using voice recognition software.

Miscellaneous Notes

Telephone Encounter - Ann-Lisa G - 07/23/2026 8:26 PM PDT

Formatting of this note might be different from the original.
Oncology Telephone Triage Note

Subjective / Visit Information:

Reason for Call: Triage (Headache, nausea)

Assessment and Plan:

Call Summary: Yvonne reports headache X 2 days and nausea that started this morning. She rates the headache 6/10 on pain scale and describes it as a "regular" headache. She denies fever, vomiting, diarrhea, blurry vision, stiff neck.

Per APP J Chang, ok to take dose of Tylenol tonight. Advised her to call back if symptoms are not improving or worsening.

Response: Yvonne states understanding and is agreeable to this plan.

Additional documentation may exist in Flowsheets or Education Activity

After Your Bone Biopsy: Precautions and self-care

Follow These Instructions Carefully
Precautions
The medicine that was used to sedate you (make you relaxed and sleepy) will be in your system for several hours after your biopsy. It could affect your thinking during this time.
Because of this, for 24 hours after your biopsy:
Do not drive a car or use machinery.
Do not drink alcohol.
Do not take tranquilizers, sleeping pills, or similar medicines unless your doctor prescribes them for you.
Self-care to Help Your Recovery
We strongly advise you to do only light activity and to get plenty of rest. Do not do any strenuous work.
Do not lift more than 10 pounds for 48 hours.
Keep your biopsy site clean and dry for 24 hours. After that, you can remove the dressing and you may shower as usual.
Do not put creams or lotions on your biopsy site for about a week.
If you wish, you may cover your biopsy site with a Band-Aid until it is healed. If you do use a Band-Aid:
Change the Band-Aid every day.
Watch the biopsy site over the next few days for any of the signs listed under “When to Call the Clinic” listed below.
You can resume your usual medications after the procedure.
Some soreness at the site is expected. Take Tylenol (Acetaminophen) or your home pain medication for relief.
Call us or your doctor's clinic if the pain is not improving after 2-3 days.

When to Call the Clinic

It is normal to have some discomfort or bruising at the biopsy site for several days. But, call the number below if you have:
Bleeding.
Swelling.
Signs of infection:
Redness.
Warmth
Discharge
Fever higher than 100°F (37.8°C) or chills.
Rapid heart rate.

Brief Procedure Note - Terrence Li - 07/24/2026 12:25 PM PDT

Formatting of this note might be different from the original.

PROCEDURE

Name of Procedure: CT guided right iliac biopsy
Procedure description: See imagine/pathology report

OPERATORS

Attending: Chankue Park, MD
Fellow: Terrence Li, MD

SAMPLES AND SPECIMENS

Under incremental CT guidance, a coaxial 14 gauge bone needle was advanced into the cortex. 18-gauge soft tissue needle was advanced into the right iliac and 4 samples of 1-2 cm tan white tissue were obtained along with multiple fragmented tissues.

COMPLICATIONS

None

ESTIMATED BLOOD LOSS

< 25 ml

DIAGNOSTIC STATUS

Post procedure diagnosis: Pending

Electronically signed by Terrence Li at 07/24/2026 12:37 PM PDT

Procedure Nursing Note - Michael L - 07/24/2026 12:25 PM PDT

Formatting of this note might be different from the original.

Pt underwent moderate sedation for CT guided bone biopsy procedure.

Of note pre-procedurally, pt had an allergy to fentanyl listed in her chart, indicating PVCs as a severe reaction to the medication. Sedation, analgesia, and comfort discussed between the patient, attending, and sedation RN at length in preparation for the procedure, and pt exhibited some skepticism towards her allergy and indicating being receptive to receiving fentanyl for her procedure.

Because pt would monitored closely on telemetry, it was agreed that the procedure would begin with a "trial" dose of 25mcg IV fentanyl followed by a short monitoring period to ensure that there were no EKG changes. Pt tolerated her initial dose of fentanyl with no issues, and so the procedure proceeded with moderate sedation utilizing IV fentanyl and midazolam for pt comfort. Two isolated PVCs were observed through the procedure (approximately 45 minute duration). Pt remained on room air with SpO2 of 100% and appropriate ETCO2 readings. BP steadily trended downward with sedation doses to a low of 85/52 towards the end of the procedure but improved shortly after, as sedation wore off.

After procedure, pt was monitored for a period where occasional, isolated PVCs were observed.

Impressions

07/24/2026 12:48 PM PDT

Technically successful and uneventful CT guided core needle biopsy of the right iliac lesion.

PRESENCE STATEMENT:
I, Dr. Chankue Park, was present during the entire procedure. I have personally reviewed the images and agree with the report (or as edited).

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/24/2026 12:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT SUPERFICIAL BONE BX

CLINICAL INDICATION:
widespread bony mets, unkonwn primary, likely solid tumor.

PREPROCEDURE:
CT reveals lytic lesion over the right iliac bone.

TECHNIQUE:
Details of the procedure were discussed with the patient and written informed consent was obtained. Specifically, the risks, benefits, and alternatives of the procedure were discussed, including, but not limited to, bleeding, infection, pain, damage to adjacent structures, and nondiagnostic specimen. The patient was able to ask questions, indicated their understanding, and agreed to proceed.

A final time out was performed prior to commencing with the procedure.

SEDATION:
Incremental doses of intravenous midazolam and fentanyl was administered by the radiology nurse for moderate sedation with direct monitoring by the attending physician. Continuous hemodynamic and respiratory monitoring was performed throughout and following the procedure.

Duration of sedation: 60 minutes with 200 mcg fentanyl and 4mg versed. Please refer to sedation report for further details.

PROCEDURE:
The patient was directed into the supine. Skin over the right iliac was marked with CT guidance. The skin was then cleansed and draped. Adequate local anesthesia was achieved with subcutaneous 1% lidocaine. Under incremental CT guidance, a 14-gauge Bonopty coaxial penetrating needle was advanced through the cortex. An 18-gauge soft tissue biopsy needle was then advanced through the coaxial system into the right anterior iliac crest lytic lesion. 4 samples of 1-2 cm tan white tissue were obtained along with multiple fragmented tissues.

Needle was removed and hemostasis easily achieved. No immediate complications.

POSTPROCEDURE:
CT did not reveal any complications such as significant hemorrhage or pneumothorax.

Postprocedure orders were given to the patient and were documented in the patient's chart. Patient was sent to the floor with no discomfort or pain and in stable condition.

Specimen was sent to pathology department.

• PATHOLOGY, SURGICAL - Edited Result - FINAL (07/24/2026 12:26 PM PDT)

Component Value Ref Range Test Method Analysis Time Performed At Pathologist Signature

Addendum 2 ADDENDUM REASON:
This addendum is issued to report the results of HER2 FISH testing performed. See Biomarker Summary template below. 08/13/2026 1:52 PM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY Addendum electronically signed by Dintzis, Suzanne Martha, MD on 8/13/2026 at 1352 PDT

Addendum 1 ADDENDUM REASON:
This addendum is issued to report ER, PR, and HER2 testing. See Biomarker Summary template below.

HER2 FISH studies have also been ordered and will be reported in a subsequent addendum.

Biomarkers Disclaimer
All controls show appropriate reactivity.

ER/PR and HER2 immunohistochemical analyses are performed in accordance with the ASCO/CAP guidelines [1,2]. Department of Pathology protocols dictate that breast cancer containing tissue will be fixed in 10% neutral buffered formalin for a minimum of 6 hours to a maximum of 72 hours at room temperature for ER/PR and HER2, unless otherwise noted in this report. All breast core biopsy specimens are rapidly immersed in formalin (Cold ischemia time is within required one hour). The detection system used is Roche Ultraview Universal DAB Detection Kit.

The Criteria used to determine a positive vs. negative result, and scoring system (eg, percent of stained cells, staining pattern) are those recommended by ASCO/CAP [1,2]. The interpretation is reported according to the CAP Reporting Template for Reporting Results of Biomarker Testing of Specimens from Patients with Carcinoma

of the Breast. Cases with 2+ (equivocal) HER2 staining will be tested for gene amplification using validated fluorescent in-situ hybridization (FISH) technique.

These assays have not been validated on decalcified tissues. Results using decalcified tissues should be interpreted with caution, given the likelihood of false negativity in this testing environment. When the above stain result indicates 'Quantitative Evaluation', a manual morphometric scoring of the stain was performed.

Synoptic Checklist Breast Biomarker Reporting Template
(Added in Addendum) BREAST BIOMARKER REPORTING TEMPLATE - All Specimens
Protocol posted: 6/18/2025

Testing Performed on Specimen / Block Number(s): A1
Test(s) Performed:
Estrogen Receptor (ER) Status: Positive (greater than 10% of cells demonstrate nuclear positivity)
Percentage of Cells with Nuclear Positivity: 91-100%
Average Intensity of Staining: Strong (3+)
Test(s) Performed:
Progesterone Receptor (PgR) Status: Positive
Percentage of Cells with Nuclear Positivity: 91-100%
Average Intensity of Staining: Strong (3+)
Test(s) Performed:
HER2 by Immunohistochemistry (IHC) Status: Equivocal (Score 2+)
: Weak to moderate complete membrane staining observed in greater than 10% of tumor cells

METHODS
Cold Ischemia and Fixation Times: Cannot be determined: Cold ischemia and formalin fixation times not documented.
Fixative: Formalin
ER Testing Methodology:
ER Test Type: Food and Drug Administration (FDA) cleared (test / vendor): Roche
ER Primary Antibody: SP1
PgR Testing Methodology:
PgR Test Type: Food and Drug Administration (FDA) cleared (test / vendor): Roche
PgR Primary Antibody: 1E2
HER2 IHC Testing Methodology:
HER2 IHC Test Type: Food and Drug Administration (FDA) cleared (test / vendor): Roche

Protocol posted: 6/18/2025

Testing Performed on Specimen / Block Number(s): A1
Test(s) Performed:
HER2 by In Situ Hybridization (ISH) Status: Negative, based on IHC and ISH results
: Group 4 ISH result (with IHC 0-2+)
HER2 ISH Testing Signal Counts and Ratio:
Average Number of HER2 Signals per Cell: 4.35
Average Number of CEP17 Signals per Cell: 3.39
HER2 / CEP17 Ratio: 1.28
Comment(s) on HER2 ISH Results: This sample has a Group 4 result (ratio less than 2.0; greater than or equal to 4.0 and less than 6.0 HER2 signals / cell). It is uncertain whether patients with greater than or equal to 4.0 and less than 6.0 average HER2 signals / cell and HER2 / CEP17 ratio less than 2.0 benefit from HER2 targeted therapy in the absence of protein overexpression (IHC 3+). If the specimen test result is close to the ISH ratio threshold for positive, there is a high likelihood that repeat testing will result in different results by chance alone. Therefore, when IHC results are not 3+ positive, it is recommended that the sample be considered HER2 negative without additional testing on the same specimen.

METHODS
Cold Ischemia and Fixation Times: Cannot be determined: Cold ischemia and formalin fixation times not documented.
Fixative: Formalin
HER2 ISH Testing Methodology:
HER2 ISH Test Type: Food and Drug Administration (FDA) cleared (test / vendor): Path Vysion Her-2 DNA probe kit/Abbott Molecular 08/13/2026 1:52 PM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY

Gross Description A. Iliac crest, Right.
Received in formalin labeled "Franklin, Yvonne; " is a 1.1 x 0.7 x 0.2 cm aggregate of tan to red-brown soft tissue and no bone grossly identified. The specimen is filtered in a mesh bag and entirely submitted in A1. (AG) 08/13/2026 1:52 PM PDT UNIVERSITY OF WASHINGTON MEDICAL CENTER PATHOLOGY

• Self-Care/Home Management

Question Answer Date of Assessment Author

ADL Comments Yvonne's primary trigger for pain from a functional standpoint is getting in and out of bed, as in her head descent to gravity. She is also unable to tolerate laying flat. OT provided education in options including use of bed wedge(s) vs 1st floor hospital bed. Also demonstrated how spouse Mark can provided physical assist at her head/neck while she transitions from sitting > supine. Yvonne describes log rolling to manage pain and OT built upon that strategy to include no bending/lifting/twisting in her day. Ordered 3 different cervical collars for patient to try and explained the mechanism of soft support. 07/28/2026 2:40 PM PDT Mary Pat Dodge

Toileting Independent 07/28/2026 2:40 PM PDT Mary Pat Dodge

• OT Assessment

Question Answer Date of Assessment Author

OT Assessment Results Impaired IADL's 07/28/2026 2:40 PM PDT Mary Pat Dodge

Impact on Function and Participation Upon interview, Yvonne is and has been able to complete bathing, toielting, dressing and self care on her own but struggles with IADLs that include any lifting or bending. OT provided education in maintaining a neutral spine and gave ideas for strategies and supplies to support her painful neck area during bed mobility. Will follow up as needed for usefulness of cervical collars and justify a hospital bed as needed. 07/28/2026 2:40 PM PDT Mary Pat Dodge

Functional Prognosis Good 07/28/2026 2:40 PM PDT Mary Pat Dodge

Barriers to Discharge none anticipated 07/28/2026 2:40 PM PDT Mary Pat Dodge

Discharge Summary

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
PCP: Paras, Leilani D, MD
Code Status: Full Code

DATE OF ADMISSION: 7/27/2026
DATE OF DISCHARGE: 07/30/26
DISCHARGE TEAM & ATTENDING: Medicine O Gen Adults & Lenaeus, Michael Jeffrey*

ADMISSION DIAGNOSIS: Stage IV breast cancer with osseous metastases
DISCHARGE DIAGNOSIS: Stage IV breast cancer with osseous metastases

PROBLEMS ADDRESSED DURING THIS HOSPITALIZATION:
Principal Problem:
Breast cancer metastasized to bone, unspecified laterality (HCC)
Active Problems:
Acute bilateral thoracic back pain
Pathologic compression fracture of vertebra (HCC)
Metastatic malignant neoplasm (HCC)
Cancer, metastatic to bone (HCC)
Resolved Problems:
* No resolved hospital problems. *

Pending Labs

No pending labs

DIAGNOSTIC STUDIES RECOMMENDED:
None

INCIDENTAL FINDINGS THAT REQUIRE FOLLOW-UP:

None

THERAPEUTIC RECOMMENDATIONS:
- Continue pain management regimen as outlined:
- MS Contin 30 mg every 12 hours
- Oxycodone 15 mg every 3 hours as needed

- Tylenol 975 mg every 8 hours
- Methocarbamol 750 mg every 6 hours as needed
- Cancer therapy as outlined below:
- Lupron 7.5 mg monthly injections
- Zometa 4mg infusions every 3-4 weeks
- Anastrozole 1 mg daily
- Recommend daily bowel regimen
- Follow up with outpatient breast oncology and FHCC pain clinic for further management (referrals pending).
- Follow up with interventional radiology for outpatient kyphoplasty procedure. Appointment scheduled 7/31.
- Follow up with primary care provider within 2 weeks of discharge.

ALLERGIES:
Propofol and Fentanyl

DISCHARGE MEDICATIONS:

Medication List

START taking these medications

acetaminophen 325 MG tablet
Commonly known as: Tylenol
Take 3 tablets by mouth every 8 hours.

anastrozole 1 MG tablet
Commonly known as: Arimidex
Take 1 tablet by mouth daily.

methocarbamol 750 MG tablet
Commonly known as: Robaxin
Take 1 tablet by mouth every 6 hours as needed for muscle spasms.

morphine ER 30 MG ER tablet
Commonly known as: MS Contin
Take 1 tablet by mouth every 12 hours.

ondansetron 8 MG tablet
Commonly known as: Zofran
Take 1 tablet by mouth every 8 hours.

senna 8.6 MG tablet
Commonly known as: Senokot
Take 2 tablets by mouth 2 times a day.

CHANGE how you take these medications
oxyCODONE 10 MG tablet
Take 1-1.5 tablets by mouth every 3 hours as needed for moderate pain.
What changed:
- medication strength
- how much to take
- when to take this

CONTINUE taking these medications

albuterol HFA 108 (90 Base) MCG/ACT inhaler
Commonly known as: Proventil HFA; Ventolin HFA

Inhale 2 puffs by mouth every 4 hours as needed for shortness of breath/wheezing.

cholecalciferol 50 mcg (2,000 unit) capsule
Commonly known as: Vitamin D-3
Take 2 capsules by mouth daily.

naloxone 4 MG/0.1ML nasal spray
Commonly known as: Narcan
Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.

polyethylene glycol 3350 17 g packet
Commonly known as: Miralax
Take 1 packet by mouth daily. Dissolve in 4-8 ounce water.

prochlorperazine 10 MG tablet
Commonly known as: Compazine
Take 1 tablet by mouth every 6 hours as needed for nausea/vomiting.

propranolol 10 MG tablet
Commonly known as: Inderal
Take 1 tablet by mouth daily.

tretinoin 0.025 % cream
Commonly known as: Retin-A
Apply 1 application topically 3 times a week. Apply to face.

STOP taking these medications
ALPRAZolam 0.25 MG tablet
Commonly known as: Xanax

oxyCODONE 10 MG tablet

BRIEF ADMISSION HISTORY:
As below

HOSPITAL COURSE:
Brief Admission History:
Per the admission note by Dr. Adrian Lazarevic-Fogelquist dated 7/28/2026:
"Undergoing outpatient workup for presumed metastatic breast cancer (breast/LN biopsy results 7/27 confirm breast cancer, pending bone biopsy results). The night preceding admission developed acute worsening of neck

and back pain to the point of being awoken from sleep and unable to bend or perform standard ADLs 2/2 severe, 10/10 pain unresponsive to home oxycodone 5-10mg. Pain is in the R neck and bilateral paraspinal regions, primarily in the upper/thoracic spine, worse with movement and associated with a feeling of "heaviness" in her head as if she cannot hold her head up due to pain/weakness in her neck.
She was seen in Radiation Oncology on 7/27 for CT sim for XRT planning and then presented to ACE clinic for severe pain and was recommended to proceed to the ED for neurosurgical evaluation given severity of neck pain and known C spine metastases.
No fevers, chills, new neurologic symptoms of focal weakness, numbness, tingling, loss of bowel/bladder control.
ED course:
Afebrile, VS notable for tachycardia and transient hypertension. Labs with mild hypokalemia and leukocytosis, otherwise unremarkable. CT spine demonstrated multiple osseous metastases with multiple associated pathologic fractures in the cervical and thoracic spine and extra-osseous extension of lesions in the C-spine (e.g. C4, C6) with associated foraminal narrowing. CTA head and neck without e/o arterial dissection or occlusion.

Admitted to medicine for pain control and possible expedited XRT."

Hospital Course:

Yvonne K Franklin is a 47-year-old female with newly diagnosed metastatic breast cancer, ER+/PR+/HER2-, who was admitted to UWMC on 7/27 for intractable cancer-related neck/back pain in setting of known osseous metastases as well as possible expedited initiation of XRT. She was previously undergoing outpatient planning for XRT with CT sim completed on 7/27. Neurosurgery was consulted in the ED, determined to be non-operative.

She was continued on home oxycodone 5-10mg every 4 hours as needed together with scheduled Tylenol 975 mg, prn IV hydromorphone, and prn methocarbamol with good pain control. On 7/28, morphine 30mg BID was initiated along with continued prn medications. On 7/29, oxycodone was increased to 15mg every 3 hours as needed with improved pain relief. She was also given scheduled anti-emetics to help with opioid-associated nausea.

MRI C-T-L on 7/28 notable for anterior epidural tumor extension at T5 and T8 levels. Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

Radiation oncology was consulted 7/28 with plan for expedited XRT as inpatient. XRT was administered on 7/29.

IR was consulted 7/28, planning for vertebroplasty/kyphoplasty following radiation treatment in outpatient setting. Follow-up consultation is scheduled for 7/31.

Medical oncology consulted 7/28 and saw pt on 7/29 to discuss hormone therapy initiation. Pt was started on lupron 7.5 mg monthly injections (first dose administered 7/29), anastrozole 1 mg daily, and Zometa 4mg every 3-4 wk infusions (first dose administered 7/30).

Over course of hospitalization, her pain was better controlled. She was discharged in stable condition on 7/30. She will follow up with oncology in the outpatient setting for ongoing cancer therapy and opioid management.

Key Diagnostic Studies:

7/22 biopsy ER+/PR+/HER2 neg

Procedures/Dates:

None

Tube/Line/Drain Care Orders / Instructions:

None

Consults:

Neurosurgery
IR
Rad Onc

Oncology Consults

Key Follow-up Needed, including Incidental Findings:
Follow up with FHCC breast oncology (referral placed) and FHCC pain clinic for opioid management
Follow up with IR for kyphoplasty as outpatient

DISPOSITION:
01 HOME/SELF CARE [01]

CONDITION: fair

CONSULTS COMPLETED:
IP CONSULT TO RADIATION ONCOLOGY
IP CONSULT TO NEUROSURGERY
IP CONSULT TO NUTRITION SERVICES
IP CONSULT TO ONCOLOGY

OPERATIONS/PROCEDURES:
No surgeries this admission

Additional procedures:
None

PRINCIPAL DIAGNOSTIC STUDIES/RESULTS:
MRI C-T-L 7/28/26:
1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

A) Right iliac crest, biopsy 7/24/26:
- Metastatic carcinoma.

A) Left breast, 1:00 7 cm FN, core biopsy 7/22/26:
- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy 7/22/26:
- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Biomarker reporting: ER positive, PR positive, HER2 negative. Negative E-cadherin supports lobular phenotype.

Discharge Orders

Discharge Instructions

• Discharge Instructions

Mike Lenaeus - 07/30/2026 8:32 AM PDT

Formatting of this note might be different from the original.
You will be receiving a call to schedule your breast oncology clinic appointment after discharge. You can also call 206-606-2016 to schedule your appointment.

You have also received a referral to the Fred Hutch Pain Clinic, which will ultimately prescribe your pain medication, in consultation with your oncologist and your primary care doctor. It can, sometimes, take time to get enrolled in that clinic - so please reschedule your PCP follow-up within two weeks to ensure your pain is managed and you avoid side effects while getting enrolled in the pain clinic. Please make sure to have regular BMs while on opioid pain medication. We have prescribed miralax and senna to that end, but you should contact your PCP and/or the pain clinic if not having regular, loose BMs. If you're pain becomes intolerable or you cannot swallow - then please return to our ED for further evaluation.

Your PCP and pain clinic can discuss driving restrictions in more detail as you recover, but do not drive while on pain medications for now.

Progress Notes

Mary Pat Dodge - 07/28/2026 7:36 AM PDT

Formatting of this note might be different from the original.

Occupational Therapy Evaluation

Patient Name: Yvonne K Franklin
MRN: U4772842
Total Treatment time: 20 Minutes

Home Living: Type of Home: Multilevel home
Entry Stairs: 2-3 without railing
Indoor Stairs: 1 flight with 1 railing the entirety of spiral staircase, intermittently has 2 railings
Lives With: Family
Lives with Comments: Mark (husband), 2 young children
Assistance Available at Home : 24 hour assistance
Bathroom Toilet: Standard
Mobility Equipment Owned: None

Home Living Comments: Kirkland, WA

Prior Level of Function: BADLs: Independent
IADLs: Requires assist
Functional Mobility: Independent
Details of previous level of function: Yvonne hasn't been able to perform IADLs including cooking, housework. Spouse Mark has taken over those.

Upper Extremities:

--- ---

Lower Extremities:

Hand Function:

Coordination:

Sensation:

Proprioception:

Vision:

Perception:

Cognition: Overall Cognitive Status: Within Functional Limits

Subjective: "It seems silly but I can't even lift a plate. I feel it all the way up my neck."

Current Level of Function

Toileting: Independent

Toilet/Commode Transfer: Independent

Therapeutic Interventions

Functional Transfers

Sit>Stand: Independent

Functional Mobility: within the room independently and ambulates with spouse Mark with arms linked together

ADL/IADL Comments: Yvonne's primary trigger for pain from a functional standpoint is getting in and out of bed, as in her head descent to gravity. She is also unable to tolerate laying flat. OT provided education in options

including use of bed wedge(s) vs 1st floor hospital bed. Also demonstrated how spouse Mark can provided physical assist at her head/neck while she transitions from sitting > supine. Yvonne describes log rolling to manage pain and OT built upon that strategy to include no bending/lifting/twisting in her day. Ordered 3 different cervical collars for patient to try and explained the mechanism of soft support.

Assessment

Assessment: Upon interview, Yvonne is and has been able to complete bathing, toielting, dressing and self care on her own but struggles with IADLs that include any lifting or bending. OT provided education in maintaining a neutral spine and gave ideas for strategies and supplies to support her painful neck area during bed mobility. Will follow up as needed for usefulness of cervical collars and justify a hospital bed as needed.

Session Tolerance: Patient limited by pain, Patient tolerated treatment well

In House OT Plan

Plan: Skilled OT

Treatment Interventions: Self-care/Home management, Caregiver education/training

Frequency: 1-2 more sessions

Coverage for Next Shift: f/u on neck collar and rule out need for rental hospital bed

Discharge Recommendations

Recommendations: No further OT needed

Barriers to Discharge: none anticipated

Assistance with: IADLs

Supervision with:

Equipment Recommended: Hospital bed vs bed wedge

Goals

1. Goal: Bed mobility, Tolerate orthosis without complications, Minimum Assist (less than 25% help needed), Adaptive equipment
Estimated Completion Date: 07/31/26

2. Goal: Toileting, Toilet transfer, Independent
Estimated Completion Date: 08/01/26

Mary Pat Dodge, OT

Progress Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

SUBJECTIVEINTERVAL HISTORY:
Pt endorses neck and back pain ongoing since February and acutely worsening over the weekend, which prompted her admission overnight. She has had stiffness in neck, upper extremities, and back that makes certain movements difficult, including bending forward at the waist and lying flat. She also notes pain with arm movements. Her pain is significantly improved on current multimodal regimen.

Pt and her husband (present at bedside) are understandably distraught regarding her recent metastatic cancer diagnosis. They would like to know more about the plan for treatment, including radiation and long term therapeutic options. Explained ongoing discussion with IR/rad onc/med onc which will inform a treatment plan in the coming days.

SCHEDULED MEDICATIONS:

- acetaminophen, 975 mg, q8h SCH
- cholecalciferol, 4,000 units, Daily
- enoxaparin, 40 mg, q HS
- polyethylene glycol 3350, 17 g, Daily
- propranolol, 10 mg, Daily
- senna, 17.2 mg, BID

INFUSED MEDICATIONS:
?

PRN MEDICATIONS:

- albuterol HFA, 2 puff, q4h PRN
- HYDROmorphone, 0.5-1 mg, q4h PRN
- HYDROmorphone, 1-2 mg, q10 min PRN
- melatonin, 3 mg, q HS PRN
- methocarbamol, 750 mg, q6h PRN
- ondansetron, 4 mg, q8h PRN
- ondansetron, 4 mg, q8h PRN
- oxyCODONE, 5-10 mg, q4h PRN
- prochlorperazine, 10 mg, q6h PRN
- prochlorperazine, 10 mg, q6h PRN

OBJECTIVE

IMAGING:?
I have reviewed the latest radiology results
MRI C-T-L Spine w wo Contrast
Result Date: 7/28/2026
1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels. Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

CTA Head and Neck Angio
Result Date: 7/27/2026
1. Normal head CT. No acute infarct, hemorrhage or mass effect. 2. Normal CTA head. No high-grade stenosis or occlusion. 3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

CT Full Spine w Contrast
Result Date: 7/27/2026
Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT.

PATHOLOGY:?
I have reviewed the latest pathology results

7/24/26:
A) Right iliac crest, biopsy:

- Metastatic carcinoma.

7/22/26:
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Biomarker reporting: ER positive, PR positive, HER2 negative. Negative E-cadherin supports lobular phenotype.

ASSESSMENT/PLAN?
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

#Stage IV breast cancer
#Diffuse osseous metastases
Breast, lymph node, and iliac crest biopsies consistent with metastatic breast cancer, ER+/PR+/HER2-, not on any systemic therapies. Admitted for pain control (iso intractable cancer-related neck/back pain with known osseous metastases) and possible expedited inpatient initiation of XRT. MRI 7/28 notable for diffuse metastatic lesions in cervical, thoracic, and lumbar spine as well as anterior epidural tumor extension at T5 and T8.

- Neurosurgery consulted in ED; no surgical intervention planned; spinal lesions not functionally unstable.
- Radiation oncology consulted; XRT scheduled tomorrow 7/29 at 3:30 pm.
- Medical oncology consulted; they will evaluate pt tomorrow 7/29 for consideration of chemotherapy initiation.
- Interventional radiology consulted re: possible vertebroplasty/kyphoplasty for stabilization (final recs pending).
- Outpatient oncologist Dr. Eaton aware. Will need to schedule for outpatient follow-up with breast oncology prior to d/c (not currently following).
- Pain management:
- MS Contin 30 mg q12h SCH
- APAP 975mg q8H SCH
- Continue home oxycodone 5-10mg q4h PRN
- IV HM 0.5-1mg q4h PRN
- Methocarbamol 750mg q6h PRN
- C-spine soft collar for comfort

#Migraines
#GAD

- Continue propranolol

- HOLD alprazolam, uses rarely outpatient

Inpatient Checklist:
Fluids/Electrolytes/Nutrition: Regular
Prophylaxis: lovenox
Lines/Drains/Airways: PIV
Disposition: Acute care pending pain control and XRT plan
Code Status: Full Code

NSGY brief progress note

47 year old female // (C-onc) [G] NP, BP; CTL pth fx [? 1' cx w/ bony mets]
Edited by: Routkevitch, Denis, MD at 7/28/2026 0546

After reviewing imaging, there is no acute neurosurgical intervention to offer at this time.

Assessment/Plan:

- Agree with radiation
- Agree with biopsy
- Agree with IR for kyphoplasties
- Please reach back out with any further questions or concerns

Neurosurgery will sign off at this time. If there is any neuro exam change, further questions or concerns, or wish for re-engagement, please page the NSGY junior resident on call.

Denis Routkevitch, MD, PhD
PGY-1, Neurological Surgery

If any questions, please page the NSGY resident signed into CORES. If there is no resident signed into CORES, please page the NSGY junior resident on call.

Electronically signed by Denis Routkevitch at 07/28/2026 10:09 AM PDT

Physical Therapy Evaluation

Yvonne K Franklin
U4772842

7/28/2026
Duration of session: 15 Minutes

Subjective
Patient Report/Self-Assessment: Pt received reclined in bed, agreeable to PT. Pre-med for pain.

Home Living
Home Living Comments: Kirkland, WA
Type of Home: Multilevel home
Entry Stairs: 2-3 without railing
Indoor Stairs: 1 flight with 1 railing the entirety of spiral staircase, intermittently has 2 railings
Lives With: Family
Lives with Comments: Mark (husband), 2 young children
Assistance Available at Home : 24 hour assistance

Mobility Equipment Owned: None

Prior Level of Function : Indep with ADLs until a few weeks ago then pt has been requiring assist from spouse iso pain

Objective
RUE Assessment
RUE Assessment: Within Functional Limits
RUE Assessment Comments: MMT not formally assessed due to pain, functional upon assessment

LUE Assessment
LUE Assessment: Within Functional Limits
LUE Assessment Comments: MMT not formally assessed due to pain, functional upon assessment

RLE Assessment
RLE Assessment: Within Functional Limits
RLE Assessment Comments: MMT not formally assessed due to pain, functional upon assessment

LLE Assessment
LLE Assessment: Within Functional Limits
LLE Assessment Comments: MMT not formally assessed due to pain, functional upon assessment

Coordination
Movements are Fluid and Coordinated : Yes

Static Sitting Balance
Static Sitting Balance Level of Assistance: Independent
Dynamic Sitting Balance
Dynamic Sitting Balance Level of Assistance: Independent
Static Standing Balance
Static Standing Balance Level of Assistance: Independent

Dynamic Standing Balance
Dynamic Standing Balance Level of Assistance: Independent

Activity Tolerance
Endurance: Tolerates less than 10 min of activity, no significant change in vital signs
Endurance Comments: Limited by pain

Functional Level:
Bed Mobility
Supine to Sit: Independent;Head of Bed Elevated;Railings used
Sit to Supine: Independent;Head of Bed Elevated;Railings used
Transfers
Sit<>Stand: Independent
Ambulation
Distance: 180ft

Assistance Needs: Supervision / Stand by assistance
Assistive Device Used: None
Gait quality/descriptors: Narrow BOS;Decreased pace;Decreased step length
Stairs
Comments: Deferred this date due to pain

Interventions:
Theract:

- Pt, caregiver edu: PT POC, PT frequency, benefit of upright mobility and small bouts of activity for pain and fatigue management, fall risk safety, role of DME
- Indep bed mobility with HOB elevated and light use of railing, demos half log roll/half "crunch" with polite refusal of log roll trial iso pain and pt report she has found the least painful way to demo bed mobility
- Indep transfers without overt LOB, no AD, cueing for pacing for pain management
- Gait as above without overt LOB, pt denies inc in pain with amb, denies lightheadedness/dizziness, pt endorses feeling unsteady due to pain meds, FWW provided for hallway ambulation if continues to feel loopy during future walks
- Stairs deferred due to pain

ASSESSMENT/PLAN
Yvonne presents to PT evaluation with impaired mobility and activity tolerance iso pain and decreased stability. She demos bed mobility, transfers, and in room mobility independently without overt loss of balance. She ambulates 2 laps around unit with supervision assist and no AD, demo'ing no overt loss of balance although pt reports unsteadiness due to pain meds. FWW provided for pt to use in hallway. Anticipate no mobility barriers for home d/c. She benefits 1-2 further inpatient PT sessions to progress mobility, trial stairs, and order DME prn.

Recommend a personal ride for transportation as the patient is able to demonstrate a transfer as needed to access their vehicle, as well as positioning tolerance to manage the ride time/distance at discharge.

Barriers to Discharge: 1 flight of stairs to access living environment, anticipate no mobility barriers

Discharge Equipment: TBD, likely FWW

Goals:
Goal: Bed mobility, Independent (Flat mattress, no railing)

Estimated Completion Date: 08/15/26
Goal: Amb with AD, Independent
Estimated Completion Date: 08/15/26
Goal: Stairs, Supervision / Stand by assistance (x1 flight)
Estimated Completion Date: 08/15/26

Acute Care PT Plan of Care:
Treatment/Interventions: Therapeutic exercise, Therapeutic functional activities, Neuromuscular re-education, Gait/Stairs training, Wheelchair management training, Patient/family training
PT Plan: Skilled PT
PT Dosage: 1-2x/week
Plan for Next Session: Pre-med for pain, stairs, order AD prn, flat bed mobility, introduce f/u PT options including FHCC OP PT

Other Recommendations:
Recommendation for PT After Hospital Discharge: Comments (OP FHCC PT?)
PT Daily Recommendations: Walking in hallway 2-3x daily

INTERVENTIONAL RADIOLOGY
CONSULT NOTE
REFERRING SERVICE: Medicine
CONSULT REASON: Vertebroplasty

PATIENT IDENTIFICATION / CHIEF COMPLAINT:
Yvonne K Franklin is a 47 year old female presenting with with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

HISTORY / INDICATION:
Pt admitted for pain control, MRI demonstrates extensive spinal metastases with several levels of compression fractures of varying acuity. No surgical intervention indicated per NSGY. Patients pain this morning is better controlled after titration of medication. She is scheduled for otpt radiotherapy currently later this week.

PHYSICAL EXAM:

Vitals (Most recent)

T: 36.7 °C BP: 114/76 HR:(!) 104RR: 17 SpO2: 98 %

ASSESSMENT AND PLAN
Yvonne K Franklin is a 47 year old female with a history of Metastatic breast cancer affecting multiple thoracic spinal levels. She is currently admitted for pain control as a result of this condition.

Given patients diffuse pain with some localized component to the affected levels as seen on imaging/spinal xray, it is possible patient would benefit from vertebroplasty. In particular, after discussion with our radiation and medical oncology colleagues, there is likely some benefit for vertebroplasty for stabilization of these levels during and following treatment. Given these benefits, will consider vertebroplasty for both structural and pain benefits, will need additional workup prior to procedure, which will follow radonc tx.

-Will plan for outpatient follow-up with Dr. Som for additional workup
-Will consider inpatient vertebroplasty in the inpatient setting if patient remains in house.
-Treatment per radiation oncology prior to vertebroplasty.

This consult was discussed with IR Attending, Dr. Som.

Thank you for the consult. Please contact Interventional Radiology (IR) via paging operator with questions at any time.

Progress Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain, admitted for pain control and expedited XRT.

SUBJECTIVEINTERVAL HISTORY:
Pt endorses increased pain overnight as well as mid-morning today. Her pain is present throughout the day, not specific to particular time, but does generally seem worse at night/with reclined position. Evaluated at ~11am, and she reported significant pain (~2 hrs since last oxycodone dose). She does not feel that ER morphine has been helping since this was initiated yesterday PM. She also has been experiencing nausea 2/2 oxycodone and IV hydromorphone use, currently receiving IV anti-emetics.

SCHEDULED MEDICATIONS:

- acetaminophen, 975 mg, q8h SCH
- cholecalciferol, 4,000 units, Daily
- enoxaparin, 40 mg, q HS
- morphine ER, 30 mg, q12h SCH
- polyethylene glycol 3350, 17 g, Daily
- propranolol, 10 mg, Daily
- senna, 17.2 mg, BID

INFUSED MEDICATIONS:
?

PRN MEDICATIONS:

- albuterol HFA, 2 puff, q4h PRN
- HYDROmorphone, 0.5-1 mg, q4h PRN
- melatonin, 3 mg, q HS PRN
- methocarbamol, 750 mg, q6h PRN
- ondansetron, 4 mg, q8h PRN
- ondansetron, 4 mg, q8h PRN
- oxyCODONE, 5-10 mg, q4h PRN

- prochlorperazine, 10 mg, q6h PRN
- prochlorperazine, 10 mg, q6h PRN

OBJECTIVE

IMAGING:?
I have reviewed the latest radiology results
XR T Spine 3 Vw
Result Date: 7/28/2026
On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast
Result Date: 7/28/2026
1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels. Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

CTA Head and Neck Angio
Result Date: 7/27/2026

1. Normal head CT. No acute infarct, hemorrhage or mass effect. 2. Normal CTA head. No high-grade stenosis or occlusion. 3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion. Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

CT Full Spine w Contrast
Result Date: 7/27/2026
Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR. * No definite new evidence of significant vertebral fracture or subluxation. * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT.

PATHOLOGY:?
I have reviewed the latest pathology results

7/24/26:
A) Right iliac crest, biopsy:

- Metastatic carcinoma.

7/22/26:
A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

Biomarker reporting: ER positive, PR positive, HER2 negative. Negative E-cadherin supports lobular phenotype.

ASSESSMENT/PLAN?
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain, admitted for pain control and expedited XRT.

#Stage IV breast cancer, ER+/PR+/HER2-

Diffuse osseous metastases

Breast, lymph node, and iliac crest biopsies consistent with metastatic breast cancer, not on any systemic therapies. Admitted for pain control (iso intractable cancer-related neck/back pain with known osseous metastases) and possible expedited inpatient initiation of XRT. MRI 7/28 notable for diffuse metastatic lesions in cervical, thoracic, and lumbar spine as well as anterior epidural tumor extension at T5 and T8.

- Neurosurgery consulted in ED; no surgical intervention planned; spinal lesions not functionally unstable.
- Radiation oncology consulted 7/28. Plan for single treatment/ 8 Gy x1. XRT scheduled today at 3:30 pm.
- Hydroxyzine 10 mg x1 given for pre-procedure anxiety.
- Medical oncology consulted; anticipate outpatient initiation of hormone therapy (final recs pending).

- AM LFTs ordered
- Interventional radiology consulted 7/28. Plan for vertebroplasty/kyphoplasty for stabilization in outpatient setting following radiation therapy.
- Outpatient oncologist Dr. Eaton aware. Will need to schedule for outpatient follow-up with breast oncology prior to d/c (not currently following).

Neck and back pain, secondary to above

Pt continues to have uncontrolled neck/back pain despite initiation of MS Contin 30 mg BID yesterday 7/28 together with oxycodone 10 mg q 4h prn and additional prn IV medications as below. She has been experiencing significant nausea 2/2 oxycodone use. Trial of 1x PO hydromorphone 4 mg was ineffective for pain control.

- Pain management:
- MS Contin 30 mg q12h SCH
- APAP 975mg q8H SCH
- Increase oxycodone to 10-15 mg q 3h PRN
- Methocarbamol 750mg q6h PRN
- Cont IV HM 0.5-1mg q4h PRN for now, though plan tooptimize PO pain management in anticipation of d/c
- Bowel reg: daily Miralax/Senna
- C-spine soft collar for comfort

Nausea, 2/2 opioid use

- Increase Zofran to 8 mg q 8h SCH; plan for scheduled antiemetics x 1 week following radiation therapy given increased pain control needs
- Cont PO compazine 10 mg q6 hrs prn

#Migraines
#GAD

- Continue propranolol
- HOLD alprazolam, uses rarely outpatient

Inpatient Checklist:
Fluids/Electrolytes/Nutrition: Regular
Prophylaxis: lovenox
Lines/Drains/Airways: PIV
Disposition: Acute care. Anticipate possible discharge Thursday 7/30 pending XRT and pain control needs.
Code Status: Full Code

Physical Therapy Discharge

Yvonne K Franklin
U4772842

7/30/2026
Duration of session: 10 Minutes

Subjective
Patient Report/Self-Assessment: Agreeable to PT, hoping to discharge today

Functional Level:
Bed Mobility
Supine to Sit: Independent
Sit to Supine: Independent
Transfers
Sit<>Stand: Independent
Ambulation
Distance: Within room

Assistance Needs: Independent
Assistive Device Used: Front wheeled walker
Gait quality/descriptors: Narrow BOS;Decreased pace;Decreased step length

Interventions:
Therex:
Theract: Pt reports recently has been holding onto spouse while walking in hospital. Edu on safe walker use, sizing, ordering. Politely declined to practice steps
Balance/Neuro Re-ed:
Gait Training:

ASSESSMENT/PLAN
Yvonne is looking forward to discharging later today, reports she has been holding onto spouses arm for stability when walking lately, agreeable that walker would be beneficial for home. Ordered FWW, edu on safe use and sizing. Pt politely declined to practice steps. No further acute PT needs

Recommend a personal ride for transportation as the patient is able to demonstrate a transfer as needed to access their vehicle, as well as positioning tolerance to manage the ride time/distance at discharge.

Barriers to Discharge: None

Discharge Equipment: FWW

Justification for Ambulatory Assistive Device

Diagnosis: R26.81 impaired balance and M62.81 generalized weakness

Length of Need: >6 Months

Assistive Device: Yvonne requires a FWW for safe ambulation and transfers within the home. Without this equipment Yvonne is at risk for falls and injury. There is not a lesser restrictive device that would serve Yvonne's safety and mobility needs. Yvonne has demonstrated safe use of this equipment during this or previous PT sessions.

Goals:
Goal: Bed mobility, Independent (Flat mattress, no railing)
Estimated Completion Date: 08/15/26
Goal: Amb with AD, Independent
Estimated Completion Date: 08/15/26
Goal: Stairs, Supervision / Stand by assistance (x1 flight)
Estimated Completion Date: 08/15/26

PT Plan of Care:
Discharge acute care physical therapy. Please re-order therapy if the patient has a change in status, and therapy interventions are needed again.

Other Recommendations:
Recommendation for further PT: Outpatient PT
PT Daily Recommendations: Walking in hallway 2-3x daily

History and Physical

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
PCP: Paras, Leilani D, MD
Code Status: Full Code

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
Undergoing outpatient workup for presumed metastatic breast cancer (breast/LN biopsy results 7/27 confirm breast cancer, pending bone biopsy results). The night preceding admission developed acute worsening of neck and back pain to the point of being awoken from sleep and unable to bend or perform standard ADLs 2/2 severe, 10/10 pain unresponsive to home oxycodone 5-10mg. Pain is in the R neck and bilateral paraspinal regions, primarily in the upper/thoracic spine, worse with movement and associated with a feeling of "heaviness" in her head as if she cannot hold her head up due to pain/weakness in her neck.
She was seen in Radiation Oncology on 7/27 for CT sim for XRT planning and then presented to ACE clinic for severe pain and was recommended to proceed to the ED for neurosurgical evaluation given severity of neck pain and known C spine metastases.
No fevers, chills, new neurologic symptoms of focal weakness, numbness, tingling, loss of bowel/bladder control.
ED course:
Afebrile, VS notable for tachycardia and transient hypertension. Labs with mild hypokalemia and leukocytosis, otherwise unremarkable. CT spine demonstrated multiple osseous metastases with multiple associated pathologic fractures in the cervical and thoracic spine and extra-osseous extension of lesions in the C-spine (e.g. C4, C6) with associated foraminal narrowing. CTA head and neck without e/o arterial dissection or occlusion.

Admitted to medicine for pain control and possible expedited XRT.

IMAGING:
I have reviewed the latest radiology results

MRI C-T-L Spine w wo Contrast

Final Result by Blackmore, Christopher Craig, MD (07/28 0142)

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result by Johnson, Chenara, MD (07/27 2148)

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

PATHOLOGY:
I have reviewed the latest pathology results
7/22 Lymph node Right and Breast Left:

Final Diagnosis

A) Left breast, 1:00 7 cm FN, core biopsy:

- Invasive lobular carcinoma. See Synoptic Checklist.

B) Lymph node, right axilla, core biopsy:

- Metastatic carcinoma, See Comment.

COMMENT:
B) Neoplastic cells are morphologically similar to the findings in part A, compatible with metastasis from breast primary.

ASSESSMENT/PLAN
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive neck/back pain.

#Stage IV breast cancer
#diffuse osseous metastases
Breast/lymph node biopsy 7/22 c/w metastatic breast cancer, not yet on any systemic therapies. Undergoing outpatient planning for XRT and recently completed CT sim on 7/27 but admitted from ACE clinic with intractable pain affecting ability to ambulate and perform ADLs outpatient. NSGY consulted in the ED, no surgical intervention planned, spine lesions not functionally unstable. Admitted for pain control and expedited inpatient initiation of palliative XRT for pain control, additionally will consult IR for consideration of vertebroplasty/kyphoplasty for structural support per outpatient NSGY note for high risk vertebral level involvement.
Consults:

- NSGY
- Radiation Oncology - order placed AM consult
- IR for vertebroplasty/kyphoplasty - order placed, AM consult

Diagnostics:
[ ] f/u MRI
Therapeutics:
Pain management

- APAP 975mg q8H SCH
- Continue home oxycodone 5-10mg q4h PRN
- IV HM 0.5-1mg q4h PRN
- Methocarbamol 750mg q6h PRN
- C-spine soft collar for comfort

#migraines
#GAD

- continue propranolol
- HOLD alprazolam, uses rarely outpatient

Medical decision-making included the following:

Acute/chronic condition that poses a threat to life/bodily function OR chronic illness with severe exacerbation/progression/side effects of treatment: Metastatic breast cancer with diffuse osseous metastases

Treatment with parenteral controlled substance(s), monitoring for oversedation, respiratory depression, and hypotension

Inpatient Checklist:
Fluids/Electrolytes/Nutrition: Regular
Prophylaxis: lovenox

Lines/Drains/Airways: PIV
Disposition: Acute care pending pain control and XRT plan
Code Status: Full Code

Consult Notes

Karma C - 07/28/2026 11:56 AM PDT

Associated Order(s): IP CONSULT TO NUTRITION SERVICES
Formatting of this note might be different from the original.
Nutrition Screen:
Patient presenting d/t acute severe neck and back pain with muscle spasms iso known diffuse lytic lesions is admitted for further management.
Is s/p CT simulation for XRT on 7/27/26

PMH significant for new stage IV breast cancer with diffuse osseous mets to multiple cervical, thoracic, and lumbar vertebral bodies with T4, T5, and T8 vertebral body pathologic fractures, iliac crest mets, s/p L breast biopsy 7/22/26, migraines, GAD

Subjective:
Roused from napping, food at bedside (bananas, yogurt, fruit, drinks) states she already had some food to eat but with poor appetite, noted emesis bag nearby, pt endorses some nausea.

Nutrition interventions:
Received consult d/t weight loss on screening.
Reviewed chart, discussed current intakes, POC.
Encouraged good po intake as tolerated, ok for small bland choices at this time.
Encouraged good po intake with adequate calories and protein to meet nutritional needs, for best outcomes during tx.

Plan:
Will continue to monitor status and POC (XRT? Chemo?)
Will monitor for adequacy of po intake
Will re-screen weekly if LOS extended

Nutrition History PTA:
Patient sleepy, keeping eyes closed, minimally engaged at this time, did not address at this time.

Po Intake:
No data found. Patient reports eating some bfast

GI: nausea (Last BM: 7/26/26)

Wounds:
R anterior hip biopsy site

Food Allergies: No food allergies

Active Diet Orders

Diet

Adult Diet Regular

UBW: 130 lb the last 6 months

Height/Weight Data:
Height: 165.1 cm (5' 5")

Consult Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

Inpatient Consult to Radiation Oncology
Consult performed by: Anderson, Eden, MD
Consult ordered by: Lazarevic-Fogelquist, Adrian, MD

?

CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26, s/p bone biopsy 7/24/26 (result pending). She presented with worsening pain from osseous mets in the spine.

Radiation oncology consulted for consideration of extensive expedited inpatient radiation therapy

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
Patient is known to our outpatient radiation oncology team, she is followed by Dr. Kang as an outpatient. They were planning for radiation therapy from approximately C3-T11, unfortunately patient's back pain worsened since the time of her simulation and she was admitted to UWMC.

Neurosurgery is not offering operative intervention, however interventional radiology considering kyphoplasty. In my discussion with her today she endorses pain largely originating from the neck and upper back. Denies weakness/numbness, or paresthesias.

She expresses a desire to initiate radiation therapy soon as possible. Radiation plan is nearly complete, planned outpatient start date was 7/30.

IMAGING:
I have reviewed the latest radiology results

XR T Spine 3 Vw

Final Result by Shibata, Dean Kazuo, MD (07/28 1614)

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast

Final Result by Blackmore, Christopher Craig, MD (07/28 0142)

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result by Johnson, Chenara, MD (07/27 2148)

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

ASSESSMENT/PLAN
Yvonne K Franklin is a 47 year old female with cancer of unknown primary, possibly breast s/p breast biopsy 7/22/26, s/p bone biopsy 7/24/26 (result pending). She presented with worsening pain from osseous mets in the spine.

Radiation oncology consulted for consideration of extensive expedited inpatient radiation therapy

Overall her presentation is consistent with pain crisis secondary to osseous metastatic lesions. We wish to make every effort to avoid a prolonged hospitalization given the need for her to establish outpatient with FHCC medical oncology for systemic therapies.

She is already planned for radiation therapy to the painful osseous lesions, however we will work to expedite her radiation start date. Anticipate radiation therapy start tomorrow 7/29. This will likely be followed by kyphoplasty as an outpatient.

Summary of Recommendations:

- Anticipate radiation therapy start 7/29/2026, 3:30 PM

This case was discussed with attending physician, Dr. Kang.

If further questions arise during this admission, I can be contacted via Epic Secure Chat for non-urgent issues, or by paging the on-call radiation oncology resident for urgent matters. The radiation oncology inpatient resident consult service will continue to follow.

Eden Anderson, MD

Formatting of this note might be different from the original.

Consult Note

Yvonne K Franklin ("Yvonne") - DOB: 6/17/1979 (47 year old female)
Gender Identity: Female Pronouns: she/her/hers
Admit Date: 7/27/2026
Code Status: Full Code

Inpatient Consult to Oncology
Consult performed by: Zhang, Michelle Yu, MD

Consult ordered by: Lenaeus, Michael Jeffrey, MD

?CHIEF CONCERN / IDENTIFICATION:
Yvonne K Franklin is a 47 year old pre-menopausal female with new dx of metastatic breast cancer (ER 3+/ PR 3+, HER2-) w/ multifocal lytic osseous lesions (biopsy confirmed breast cx) and pathologic thoracic compression.

SUBJECTIVEHISTORY OF PRESENT ILLNESS:
She had mammogram 4/2025 that was benign. She was then in her overall state of health when she had onset of backpain 2/2026. The pain progressively got worse - she did not notice functional limitations until ~ 3 weeks ago when she had more pain with carrying plates/ things around the house.

She presented for care and subsequently had MRI spine 7/1/2026 with expansile lesions in T1, T5, T8-T10 with expansile element in T10. CT chest/abdomen/pelvis on 7/13/26 showed diffuse bony lesions throughout spine and pelvis, left 11th rib fracture. Few scattered lung nodules.

She was seen in clinic 7/15 with undiagnosed mass clinic. She had a PET-CT 7/21 with FDG avid lesion in L breast c/f breast neoplasm, R LAD, innumerable FDG avid lesions associated with compression fractures involving several vertebral bodies.

Her last period was ended ~ 2 weeks ago. It was much longer than typical e.g. 3 weeks- she just had IUD removed. On ROS denies dental issues or other chronic health conditions.

Estrogen exposure: she was on birth control pills from 18-33 then switched to Mirena IUD. This is her second IUD.
ECOG: 1 pain limiting function but remained active. She was walking 30 minutes but more slowly due to pain.
SH: works in office. She has two kids 9& 11 yo. She drinks 1-2 drinks alcohol on a few to most nights of the week. Denies history of smoking.
FH: grandmother had colon cancer at in 60s
ONCOLOGY HISTORY:
7/13/2026: CT CAP lytic lesions, L 11 rib fracture a few lung nodules.
7/21/2026: PET-CT w FDG lesions in L breast, R axilla, FDG avid osseous lesions, compression fracture.
7/22/2026: R axilla LN biopsy- metastatic carcinoma, L breast core biopsy - IDC. Biopmarker of L breast shows ER+ (3+) PR (3+) HER2 negative. Ki-67 21-30%

ASSESSMENT/PLAN
Yvonne K Franklin is a 47 year old pre-menopausal female with new dx of metastatic breast cancer (ER 3+/ PR 3+, HER2-) w/ multifocal lytic osseous lesions (biopsy confirmed breast cx) and pathologic thoracic compression.

#lytic lesions
T4,T5, T8, sternum, ribs
L 9th rib expansile lesion w/ soft tissue component
#11th rib fracture
#Lytic lesions in throracolumbar spine/ sacrum as well as bilateral iliac bones
#few lung nodules - indeterminate

Today we reviewed she has metastatic (stage IV) breast cancer, meaning it is incurable. However there are many lines of effective treatment in metastatic breast cancer / survival is generally measured on the timeline of years. Given her ER+/PR+ status, she is a candidate to start inpatient hormone therapy. We would recommend she speak further without patient oncologist regarding long term treatment planning - standard first line therapy would include additional CDK4/6 inhibitor.

For her symptoms we would recommend adding zometa for bony pain and will also help with bone density. Can also consider adding NSAID for multimodal control of bony pain as well.

- add on ca 15-3
- lupron 7.5mg (1 mo dose)
- anastrazole 1mg daily
- zometa 4mg
- consider NSAID for additional adjunctive pain control
- outpatient oncology fu
- consider child life referral

Please reach out if you have any questions or concerns. Patient was staffed with Dr. Coveler, attending physician.

Patient Summary
47 year old female with newly diagnosed stage IV breast cancer not on any systemic therapy with metastatic disease to spine presenting with rapidly progressive pain and inability to perform ADLs. Admitted for pain control and expedited inpatient initiation of palliative XRT for pain control.

0700-1930
Pt A&O x4. Ongoing moderate to severe back pain and muscle spasms. PRN Robaxin, Dilaudid, and Oxycodone administered with mild-moderate effect. XRT today 7/29 at 1530. Med onc consulting. Ambulates with SBA.Patient pain regiment changed. Increased oxycodone 10-15 mg and oral zofran scheduled for nausea related to oxycodone. PRN Dilaudid given before XRT. Oxycodone, milk of mag, Robaxin given after XRT. Ne LupronDepot initiated.

HISTORY OF PRESENT ILLNESS AND REVIEW OF SYSTEMS

Yvonne K Franklin is a 47 year old female patient with history of progressive neck and thoracic pain since February recently found to be secondary to metastatic brain cancer with diffuse lytic bone lesions who presents with severe neck pain.

Patient developed acute severe neck and back pain with muscle spasms that began around last night. She has been using oxycodone to help with her pain, takes 10 mg every 4 hours though this is not adequate to control her pain now. She presented to the oncology clinic earlier today for evaluation. Had a radiation oncology appointment today for CT simulation for planned palliative radiation therapy. In oncology clinic, she underwent a CT full spine which demonstrated worsening osteolytic lesions with pathologic fractures and spinal stenosis. She was sent to the ED for admission. Endorses severe neck and back pain at this time. Denies paresthesias or paralysis, bladder or bowel issues
Has not noticed any difficulty moving her limbs or numbness and tingling anywhere in her body. She does note that is very difficult to walk because of her pain and that when she raises her arms up it also exacerbates her pain.
D
Denies any shortness of breath, chest pain, nausea or vomiting, changes in urinary or bowel habits.

Review of systems as noted above in HPI otherwise other systems reviewed and found to be negative or noncontributory.

External records of patient were reviewed: Oncology note from today.
Interpreter was not used
An independent historian was not used to corroborate patient's presentation and history.

MEDICATIONS AND ALLERGIES

OUTPATIENT MEDICATIONS:

Current Outpatient Medications

Medication Instructions

- naloxone 4 MG/0.1ML nasal spray Use 1 spray in one nostril for suspected opioid overdose. Call 911. If unresponsive in 2 to 3 minutes, repeat with new naloxone nasal spray in opposite nostril.
- oxyCODONE 5-10 mg, Oral, Every 4 hours PRN
- prochlorperazine (COMPAZINE) 10 mg, Oral, Every 6 hours PRN
- propranolol (INDERAL) 10 mg, Daily

ALLERGIES:
Review of patient's allergies indicates:

Allergies

Allergen Reactions

- Propofol Palpitations and Other

PVC's

Palpitation

- Fentanyl Other

Isolated PVCs

SOCIAL HISTORY AND FAMILY HISTORY

Wt 126 lb 1.7 oz (57.2 kg) Ht 5' 5" (1.651 m) Body mass index is 20.98 kg/m².

Vital signs and nursing notes reviewed

Physical Exam
GEN: tearful-appearing patient on ED stretcher, moderate distress
EYES: EOMI, no discharge or bleeding
NOSE: no rhinorrhea
MOUTH: no visible lesions on oral mucosa
CARDIAC: RRR, no rubs/murmurs, strong radial pulse, no pedal edema
CHEST: symmetric chest rise and fall, no accessory muscle use, CTAB - no wheezing/rhonchi/rales
ABDOMEN: non-distended, soft, non-tender, no masses palpable

MSK: Significant midline tenderness of the C-spine on palpation, limited range of motion of the neck due to significant pain
SKIN: no erythema, rashes, abrasions, lacerations, edema on visible skin
NEURO: patient is alert and oriented, able to answer questions appropriately and follow commands
CN: pupils are 3 mm, equal, round, reactive to light bilaterally, EOMI, sensation intact to all facial dermatomes, facial muscles symmetric at rest and on activation, hearing grossly intact, palatal rise symmetric on phonation, tongue protrusion midline, SCM strength intact
MOTOR: moving all extremities spontaneously, limited flexion of BUE d/t pain, symmetric grip strength, finger extension intact bilaterally, no pronator drift bilaterally, no drift of BLE, dorsiflexion against resistance intact bilaterally
SENSORY: sensation to crude touch intact to upper and lower extremities bilaterally

CBC (HEMOGRAM)

IMAGING:

ED Wet Read:

XR T Spine 3 Vw

Final Result

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

MRI C-T-L Spine w wo Contrast

Final Result

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels

Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

CTA Head and Neck Angio

Final Result

1. Normal head CT. No acute infarct, hemorrhage or mass effect.

2. Normal CTA head. No high-grade stenosis or occlusion.

3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:

I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

IP Consult to Interventional Radiology (Results Pending)

Radiology Final Result:
No image results found.

ED COURSE/MEDICAL DECISION MAKING

Nontoxic but anxious appearing 47-year-old female with a history of metastatic breast cancer with diffuse lytic bone lesions and possible trickle vertebral fractures presenting from oncology clinic where she presented with worsening neck and back pain. CT full spine demonstrated lytic osseous metastases involving multilevel vertebra with pathologic fractures, some extraosseous extension of the spine with spinal canal narrowing. She was sent to the ED for admission and further workup of her pain. I discussed this patient with oncology and neurosurgery and they have requested further imaging studies. Plan for symptomatic control and admission for further workup and management.

Please see ED course below for updates on patient's workup and management.

ED course:

ED Course as of 07/28/26 1934

Mon Jul 27, 2026

1935 Discussed patient's case with oncology. Oncology stated that preliminary plan was to have IR consult and possible radiation oncology. However with spinal findings, neurosurgery was involved and had requested MRI full spine and CTA head and neck pending neurosurgery recommendations, patient will be admitted to med service [TL]

1935 I discussed patient's case with medicine triage. They asked that we wait for neurosurgery recommendations prior to admission. Paged neurosurgery. [TL]

2000 I discussed patient's case with neurosurgery. No plans for operative management, neurosurgery will not admit to their service. Plan for admission to medicine of service. I informed oncology and medicine team [TL]

ED Course User Index
[TL] Le, Tudi, MD

I discussed patient's presentation and/or management with: oncology, NSGY, medicine.
Social determinants of health that affect patient's care today include: NA

Based on patient's HPI, examination, and today’s work-up, it is my clinical judgement patient's presentation is most consistent with metastatic breast cancer, pathologic spinal fractures, lytic spinal lesions. Labs and/or imaging were independently interpreted by me. On reassessment, patient's vitals were stable and their exam remained unchanged.

Ultimately, patient was admitted to medicine O service. Sign out to admitting provider is complete

Medications given in the ED:

Medications

albuterol HFA (Proventil HFA; Ventolin HFA) 108 (90 Base) MCG/ACT inhaler 2 puff (has no administration in time range)

cholecalciferol (Vitamin D-3) tablet 4,000 units (4,000 units Oral Given 7/28/26 0819)

oxyCODONE tablet 5-10 mg (10 mg Oral Given 7/28/26 1536)

propranolol (Inderal) tablet 10 mg (10 mg Oral Given 7/28/26 0820)

enoxaparin (Lovenox) injection 40 mg (40 mg Subcutaneous Given 7/27/26 2219)

acetaminophen (Tylenol) tablet 975 mg (975 mg Oral Given 7/28/26 1348)

melatonin tablet 3 mg (has no administration in time range)

polyethylene glycol 3350 (Miralax) packet 17 g (17 g Oral Given 7/28/26 0819)

senna (Senokot) tablet 17.2 mg (17.2 mg Oral Given 7/28/26 0819)

ondansetron (Zofran) tablet 4 mg (has no administration in time range)

ondansetron (Zofran) injection 4 mg (4 mg Intravenous Given 7/28/26 0819)

prochlorperazine (Compazine) injection 10 mg (10 mg Intravenous Given 7/28/26 1019)

prochlorperazine (Compazine) tablet 10 mg (has no administration in time range)

HYDROmorphone (Dilaudid) injection 0.5-1 mg (0.5 mg Intravenous Given 7/28/26 0819)

methocarbamol (Robaxin) tablet 750 mg (750 mg Oral Given 7/28/26 1024)

morphine ER (MS Contin) ER tablet 30 mg (has no administration in time range)

ondansetron (Zofran) injection 8 mg (8 mg Intravenous Given 7/27/26 1943)

lactated ringers IV Bolus 1,000 mL (1,000 mL Intravenous New Bag/Syringe 7/27/26 1951)

iohexol (Omnipaque) 350 MG/ML contrast 100 mL (100 mL Intravenous Contrast Given 7/27/26 2018)

LORazepam injection 1 mg (1 mg Intravenous Given 7/27/26 2213)

gadoteridol (Prohance) 279.3 MG/ML contrast injection 6 mmol (6 mmol Intravenous Contrast Given 7/27/26 2335)

potassium chloride ER tablet 40 mEq (40 mEq Oral Given 7/28/26 0617)

CLINICAL IMPRESSION/DISPOSITION

Clinical Impression:

Clinical Impressions:

[M54.2] Neck pain

[C79.9] Metastatic breast cancer to bone diffusely

[M54.6] Acute bilateral thoracic back pain

[M48.50XA] Pathological compression fracture of vertebra, initial encounter (HCC)

Follow Up:
No follow-up provider specified.

• XR T SPINE 3 VW - Final result (07/28/2026 2:27 PM PDT)

Anatomical Region Laterality Modality

T-spine N/A Digital Radiography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 4:06 PM PDT

Impressions

07/28/2026 4:14 PM PDT

On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.

Narrative

07/28/2026 4:14 PM PDT

This result has an attachment that is not available.

EXAMINATION:
XR T SPINE 3 VW

CLINICAL INDICATION:
Localize levels of pain in spine

COMPARISON:
July 27, 2026 thoracic spine MRI and CT..

• MRI C T L SPINE WO/W CONTRAST (MRI C-T-L SPINE WO/W CONTRAST) - Final result (07/27/2026 11:57 PM PDT)

Anatomical Region Laterality Modality

C-spine, T-spine, L-spine N/A Magnetic Resonance

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/28/2026 1:12 AM PDT

Impressions

07/28/2026 1:42 AM PDT

1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/28/2026 1:42 AM PDT

This result has an attachment that is not available.

EXAMINATION:
MRI C-T-L SPINE WO/W CONTRAST

CLINICAL INDICATION: Stage IV breast cancer.
metastatic cancer, lytic lesions in spine, spinal stenosis

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,6 mmol Intravenous,07/27/2026 2357

COMPARISON:
CT 7/27/2026.

FINDINGS:

SPINAL CORD: The conus medullaris terminates at the level of L1-L2, was in normal limits. There is no abnormal cord signal or abnormal cord enhancement.

SPINE: Mild apparent straightening of the normal cervical lordosis could be positional. The normal thoracic kyphosis is maintained. There is mild apparent straightening of the normal lumbar lordosis. Small central disc protrusions are seen at C3-C4, C5-C6 and C6-C7 as well as L2-L3 and L3-L4 resulting in impression of the ventral thecal sac. There is no significant canal or foraminal stenosis.

There is diffuse osseous metastasis in the cervical, thoracic, lumbar and sacral vertebral bodies as well as posterior elements.There are mild compression fractures involving T4, T5 (40% height loss) and T8 vertebral bodies. Possible fluid fluid level at T5 may represent hemorrhage within the vertebral body. L3 vertebral body demonstrates superior and inferior endplate Schmorl's nodules.

There is anterior epidural soft tissue extension at T5 (series 1301 image 10/17) and T8 (series 1601 image 18/62 without cord compression. There may also be possible epidural extension at T4.

Procedure Note

• CTA HEAD AND NECK ANGIO - Final result (07/27/2026 8:17 PM PDT)

Anatomical Region Laterality Modality

Brain N/A Computed Tomography

Specimen (Source) Anatomical Location / Laterality Collection Method / Volume Collection Time Received Time

07/27/2026 9:18 PM PDT

Impressions

07/27/2026 9:48 PM PDT

1. Normal head CT. No acute infarct, hemorrhage or mass effect.
2. Normal CTA head. No high-grade stenosis or occlusion.
3. Normal CTA of the neck vessels. No stenosis, dissection or occlusion.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

ATTENDING COMMENT:
I agree with the preliminary report with the following comments:

Mucous retention cysts in the bilateral maxillary sinuses.

Fetal origin of the left PCA.

Common origin of the left common carotid and right brachiocephalic arteries from the aortic arch.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 9:48 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CTA HEAD AND NECK ANGIO

CLINICAL INDICATION:
metastatic cancer, pathologic neck fractures, NSGY requesting vascular imaging

TECHNIQUE:
CTA Head and Neck Stroke (N-48)
1. Non-contrast head: Contiguous axial sections were obtained through the head without contrast.
2. CTA Head/Neck: Contiguous axial sections were obtained from the aortic arch to the vertex during bolus infusion of contrast. Slab MIP reformatted images of extracranial and intracranial vessels were obtainedmultiple planes. 3. Post-contrast head: Contiguous axial sections were obtained through the head after contrast injection. Patient age specific scan parameters were used for radiation exposure.

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,100 mL Intravenous,07/27/2026 2017

COMPARISON:
Same-day CT full spine.

FINDINGS:

NON-CONTRAST HEAD CT:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: The brain parenchyma is normal. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Cavernous carotids and vertebral vessels are normal.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear. Bilateral lens placements. Dental hardware..

POST-CONTRAST HEAD CT:
ENHANCEMENT: Normal intracranial enhancement.

HEAD CTA:
ARTERIES: Normal intracranial arteries. No aneurysm, AVM, stenosis or occlusion.
VARIANTS: Fetal origin of the left posterior cerebral artery. The right posterior communicating artery is diminutive..
VEINS: Dural sinuses and deep venous structures are normal.

NECK CTA:
AORTIC ARCH: Aortic arch and great vessel origins are unremarkable, bovine arch.
CAROTIDS: Common carotid vessels are normal. Internal carotid artery origins show no stenosis. Cervical ICA's are normal.
VERTEBRALS: Vertebral artery origins are normal. Cervical vertebral segments are normal.

Diffuse osseous lesions of the spine are described on same-day CT full spine.

Impressions

07/27/2026 5:18 PM PDT

* Extensive lytic osseous metastases involving multilevel vertebral bodies and posterior elements. Redemonstrated age-indeterminant mild pathologic fractures (<25% height loss) in the C4, C6, T1, T4, T5, T8, and L5 levels. Findings are grossly similar to the prior PET/MR.
  * No definite new evidence of significant vertebral fracture or subluxation.
  * Of note, there are some extra-osseous extension involving left C4/5, left C6/7, and right T8/9 foraminal canals, and S1, S2/3 anterior epidural extension, resulting in spinal canal narrowing as described. Findings are similar to the 07/13/2026 abdominal CT. Consider MRI for evaluation of epidural/foraminal canal involvement if clinically warranted.
  * Of note, the left C4 and C6 lateral process involvement may involve the left V2 vertebral artery. Consider neck CTA to evaluate luminal patency if clinically warranted.

I have personally reviewed the images and agree with the report (or as edited).

Narrative

07/27/2026 5:18 PM PDT

This result has an attachment that is not available.

EXAMINATION:
CT FULL SPINE W CONTRAST

CLINICAL INDICATION:
ACE patient - newly dx metastatic breast cancer. Acute on chronic bilateral cervical pain and left sided thoracic/lumbar pain.

COMPARISON: PET/MR on 07/21/2026; Spinal MRI on 07/01/2026

TECHNIQUE:
Contiguous axial sections were obtained through the cervical, thoracic, and lumbar spine from the occiput through sacrum with contrast.? Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.?

CONTRAST:
IOHEXOL 350 MG/ML IV SOLN,80 mL Intravenous,07/27/2026 1500

FINDINGS:

CERVICAL SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the C4 lesion involving the left pedicle. Mild height loss of C4 and C6 vertebrae.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES: No appreciable epidural soft tissue mass in this CT exam. Some extra-osseous soft tissue extension of the left C4 and C6 lateral transverse process lytic lesions, resulting in left foraminal canal narrowing.

THORACIC AND LUMBAR SPINE:
ALIGNMENT: Straightening alignment. No subluxations.
VERTEBRAE: Multifocal lytic lesions involving in vertebral bodies and posterior elements, for example the T8 lesion involving the right pedicle. Mild compression fractures (<25%), for example T1, T4, T5, and T8 levels, grossly similar to 07/01/2026 thoracic spine MRI.
CORD: Limited evaluation, grossly unremarkable.
SOFT TISSUES:
* Some extra-osseous soft tissue extension of the right T8 transverse process lytic lesions, resulting in right T8/9 foraminal canal narrowing.
* One dominant S1 lytic lesion with posterior cortical destruction and extra-osseous anterior epidural soft tissue mass, measuring 29 x 34 mm in axial dimensions (304/686). The lesion compresses anterior thecal sac. Another lytic lesion at the S2/3 level also compresses thecal sac and narrows the adjacent right foraminal canal.

EXTRA-SPINAL FINDINGS:
Multifocal lytic lesions involving sternum, ribs, scapulae, and pelvic girdles. Otherwise, no acute findings identified. Please refer to the recent PET/MRI for extraspinal disease.

Progress Notes

Zena C - 07/27/2026 10:30 AM PDT

Formatting of this note might be different from the original.
Radiation Treatment Plan:
Consent07/27/26
RN Teach07/27/26
SIM07/27/26

Radiation Treatment Site: thoracic spine

of Fractions: TBD

RN met with patient in clinic. She ambulates independently. She was accompanied by her husband, Mark.

RN provided verbal and written information about the CT simulation, radiation treatment, and possible side effects, including fatigue, dermatitis, esophagitis, and pain flare.

Advised pt not to apply lotion or ointment to skin in Tx area prior to RT.

Confirmed pt does not have a pacemaker.

Provided business card with clinic contact information.

Electronically signed by Zena C at 07/27/2026 11:54 AM PDT

Plan Name OP ACE Cancer Pain Crisis Management

Status Active

Start Date 7/27/2026

End Date 7/27/2026

Provider Lily Kiely, PA-C

Chemotherapy [No matching medication found in this treatment plan]

ONCOLOGY HISTORY

Oncology History Overview

7/1/26: MRI T Spine
IMPRESSION:
Diffusely heterogeneous T1 hypointense and multifocal T2 hyperintense marrow signal including 2.3 x 2.3 cm expansile aneurysmal bone cyst like lesion in T5 vetebral body and similar lesions in T1, T8, T9, T10 and vertebral bodies, as well as 1.2 x 1.1 cm expansile T1 isointense, T2 hyperintense lesion in the posterior elements of T10. Additionally there is a 1.8cm ovoid T2 hyperintense mass in the visualized posterior right liver lobe. While multiple aneurysmal bone cysts is a small possibility, the appearance is highly concerning for metastases from unknown primary. Recommend CT chest, abdomena nd pelvis with contrast or PET/CT for further evaluation.
Compression deformities of T1, T4, T5 and T8 vertebral bodies which may be pathologic.
Mild bilateral neural foraminal narrowing at T8-9 secondary to bony expansion.

7/13/26: CT Chest
IMPRESSION
* Multiple osseous lytic lesions, as described, concerning for a neoplastic process.
* Fracture of the left 11th rib.
* A few scattered nodules, measuring up to 4 mm. In the context of a potential primary malignancy, a follow-up CT of the chest in 3 months is advised.

7/13/26: CT A/P
IMPRESSION
Diffuse lytic bone lesions throughout the spine and pelvis without CT evidence of primary malignancy in the abdomen or pelvis. Small bilateral ovarian cysts would be better characterized on transvaginal ultrasound.

7/22/26 PET/MR: Lt breast lesion 3.3x2.4cm SUVmax 1.9 with Rt axillary node 9x8mm SUVmax 2.0.
Innumerable bony foci including compression fractures of T4, T8, L5.
[image]

INTERVAL HISTORY

Yvonne presents to ACE via referral from primary oncology team for evaluation of acute on chronic neck and back pain with muscle spasms.

She developed acute, severe neck and back pain with muscle spasms beginning last night around 10 pm. Patient reports that she has had ongoing cervical and thoracic back pain iso newly diagnosed lytic lesions with undiagnosed primary; however, this pain has significantly worsened with muscle tightness in the neck, shoulder blades, and left thoracic/lumbar region. She is unable to lay down or move without debilitating pain and slept sitting up due to discomfort. She describes a sensation that her head is "too heavy" for her neck and expresses concern about rapid progression of symptoms.

Her current pain regimen includes oxycodone 5-10 mg every four hours and tylenol, with minimal relief. She has not been on a long-acting opioid. She also uses prochlorperazine for nausea; however, endorses poor appetite.

She had an appointment with radiation oncology today for a CT simulation for planned palliative radiation treatment. She denies lightheadedness, dizziness, chest pain, shortness of breath, abdominal pain, nausea, vomiting, new bladder or bowel dysfunction, new swelling or pain in her legs, or weakness or sensory changes in her extremities.

REVIEW OF SYSTEMS

Review of Systems
Constitutional: Negative for fever.
Cardiovascular: Negative for chest pain and dyspnea on exertion.
Respiratory: Negative for cough and shortness of breath.
Musculoskeletal: Positive for back pain, neck pain and stiffness. Negative for muscle weakness.
Gastrointestinal: Negative for abdominal pain, change in bowel habit, nausea and vomiting.
Genitourinary: Negative for dysuria.
Neurological: Negative for dizziness, headaches, light-headedness, numbness, paresthesias and sensory change.

Psychiatric/Behavioral: Negative for altered mental status.
?

PROBLEM LIST

Active Ambulatory Problems

Diagnosis Date Noted

- Secondary malignant neoplasm of bone (HCC) 07/22/2026
- Neck pain 07/27/2026
- Cancer related pain 07/27/2026
- Breast cancer metastasized to bone, unspecified laterality (HCC) 07/27/2026
- Acute bilateral thoracic back pain 07/28/2026
- Pathologic compression fracture of vertebra (HCC) 07/28/2026
- Metastatic malignant neoplasm (HCC) 07/28/2026
- Cancer, metastatic to bone (HCC) 07/28/2026

Resolved Ambulatory Problems

Diagnosis Date Noted

• No Resolved Ambulatory Problems

Past Medical History:

Diagnosis Date

• Breast cyst Always

HOME MEDICATIONS

Current Outpatient Medications

ALLERGIES

Review of patient's allergies indicates:

Allergies

Allergen Reactions

• Propofol Palpitations and Other

PVC's

Palpitation

• Fentanyl Other

Isolated PVCs

PHYSICAL EXAMINATION

Physical Exam
Constitutional:
Appearance: Normal appearance.
HENT:
Head: Normocephalic and atraumatic.
Mouth/Throat:
Mouth: Mucous membranes are moist.
Eyes:

Extraocular Movements: Extraocular movements intact.
Cardiovascular:
Rate and Rhythm: Normal rate and regular rhythm.

Pulses: Normal pulses.
Heart sounds: Normal heart sounds.
Pulmonary:
Effort: Pulmonary effort is normal.
Breath sounds: Normal breath sounds.

Abdominal:
General: Abdomen is flat. There is no distension.
Palpations: Abdomen is soft.
Musculoskeletal:
Cervical back: Normal range of motion.
Comments: No spinal tenderness on palpation. Bilateral paraspinal tenderness on cervical spine and paraspinal tenderness on left side of thoracic and lumbar spine.
Skin:
General: Skin is warm and dry.

Neurological:
Mental Status: She is alert and oriented to person, place, and time.
Psychiatric:
Mood and Affect: Mood normal.
Behavior: Behavior normal.

IMAGING/PERTINENT STUDIES

Ultrasound Guided Axillary Lymph Node Biopsy Right
Addendum: Pathology results reveal axillary node with metastatic carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/2026 at 1556.
Narrative: Examination:

Ultrasound Guided Axillary Lymph Node Biopsy Right
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Axillary Lymph Node Biopsy Right:
Images of the lymph node in the right axilla were obtained. The axilla was prepped for the procedure and the area was anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Two specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1445)

A post procedure right digital mammogram confirms the biopsy marker clip is in the appropriate position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Right Ultrasound Guided Axillary Lymph Node Biopsy complete.
US Guided Breast Biopsy Left, Post Procedure Diagnostic Mammography Left
Addendum: Pathology results reveal invasive lobular carcinoma which is malignant and concordant with the imaging findings.

Recommend referral to Multidisciplinary Clinic. Breast MRI is also recommended for further evaluation of extent of disease.

These pathology findings and recommendations were reported to the patient by Jessica Hui on 7/27/26 at 1556.
Narrative: Examination:
Ultrasound Guided Breast Biopsy Left
Post Procedure Diagnostic Mammography Left
The procedure was explained to the patient including benefits and alternatives. The risks, including but not limited to infection, bleeding, pain, and/or inadequate sampling were reviewed. The patient agreed to undergo the procedure and signed the consent form.

Ultrasound Guided Breast Biopsy Left:
The patient's left breast was imaged and images of the mass in the upper outer quadrant at 1 o'clock at a distance of 7 cm from the nipple were obtained. The breast was prepped for the procedure and the area was

anesthetized with a local anesthetic. A Core Biopsy Needle was placed in the target using a lateral approach. Three specimens were obtained. A biopsy marker clip was placed at the site of the core biopsy.

The patient experienced no complications during the procedure. The estimated blood loss for the procedure was <5 cc.

Medication dose given
lidocaine (Xylocaine) 1 % injection 10 mL (4 mL Intradermal Given 7/22/26 1446)

A post procedure left digital mammogram confirms the biopsy marker clip is in the expected position

I, Dr. Matthew Duke Phelps, was present for the entire procedure. I have personally reviewed these images and I agree with the report above.

At this time, pathology is pending. This report will be addended when the final pathology report of the biopsy specimen is received.

Impression:
Single Site Left Ultrasound Guided Breast Biopsy complete.
XR T Spine 3 Vw
Narrative: EXAMINATION:
XR T SPINE 3 VW

CLINICAL INDICATION:
Localize levels of pain in spine

COMPARISON:
July 27, 2026 thoracic spine MRI and CT..

FINDINGS AND
Impression: On the standing AP, lateral, and swimmer's views, skin metallic markers are noted at apparent levels of pain centered at the T1/2 level and the upper T7 level. The multiple lytic lesions throughout the thoracic spine are better visualized on the prior day CT but grossly stable again consistent with bony metastases without definite evidence of gross pathologic fracture. Again there is essential anatomic alignment on the lateral and frontal views. There are mild degenerative disc changes in the mid and lower thoracic spine.
MRI C-T-L Spine w wo Contrast
Narrative: EXAMINATION:
MRI C-T-L SPINE WO/W CONTRAST

CLINICAL INDICATION: Stage IV breast cancer.
metastatic cancer, lytic lesions in spine, spinal stenosis

TECHNIQUE:
MRI Cervical Spine without and with contrast: Extramedullary - tumor (C 4)
Non-contrast: Sag T1, STIR. Ax T1, T2, in-out of phase Post-contrast: Sag , Ax T1 fat sat

MRI Lumbar Spine without and with contrast: extramedullary tumor
Non-contrast: Sagittal T1, T2, STIR. Axial T1, T2, in-out of phase Post-contrast: Sagittal, axial T1 fat sat.

CONTRAST:
GADOTERIDOL 279.3 MG/ML IV SOLN,6 mmol Intravenous,07/27/2026 2357

COMPARISON:
CT 7/27/2026.

FINDINGS:

SPINAL CORD: The conus medullaris terminates at the level of L1-L2, was in normal limits. There is no abnormal cord signal or abnormal cord enhancement.

SPINE: Mild apparent straightening of the normal cervical lordosis could be positional. The normal thoracic kyphosis is maintained. There is mild apparent straightening of the normal lumbar lordosis. Small central disc protrusions are seen at C3-C4, C5-C6 and C6-C7 as well as L2-L3 and L3-L4 resulting in impression of the ventral thecal sac. There is no significant canal or foraminal stenosis.

There is diffuse osseous metastasis in the cervical, thoracic, lumbar and sacral vertebral bodies as well as posterior elements.There are mild compression fractures involving T4, T5 (40% height loss) and T8 vertebral bodies. Possible fluid fluid level at T5 may represent hemorrhage within the vertebral body. L3 vertebral body demonstrates superior and inferior endplate Schmorl's nodules.

There is anterior epidural soft tissue extension at T5 (series 1301 image 10/17) and T8 (series 1601 image 18/62 without cord compression. There may also be possible epidural extension at T4.
Impression: 1. No cord compression. Anterior epidural tumor extension at T5 and T8 levels
Diffuse osseous metastasis multiple cervical, thoracic and lumbar vertebral bodies. Pathologic fractures involving T4, T5 and T8 vertebral bodies with mild height loss at T5 (40%).

This is a preliminary report dictated by Abraham Mengstu M.D., neuroradiology fellow (PGY-6).

Unless an Attending Final Impression appears below, the report has not yet been finalized and an attending radiologist has not reviewed these images.

ATTENDING FINAL REVIEW:

I have personally reviewed the images & agree with the report (or as edited). Bilski grade at T8 is 1C.

I have personally reviewed the images and agree with the report (or as edited).

ASSESSMENT/PLAN

Assessment & Plan
Yvonne K Franklin is a 47-year-old female with cancer of metastatic breast cancer with diffuse lytic bone lesions and pathologic vertebral fractures. Patient's pathology came back today and she has not established with breast oncology to discuss treatment.

Patient presents today with chief complaint of significant worsening of neck and back pain.

In ACE, afebrile, BP 134/91 mmHg, HR 92, RR 18, SpO2 100% on RA. Initially experiencing 10/10 neck pain despite taking extra dose of 10 mg oxycodone.

Work-up:

- CMP overall stable
- CBC overall stable

Ordered CT full spine to further assess acute on chronic spinal pain that is impacting ADLs.

Resuscitated with 1 mg IV, 0.5 mg IV, 1 mg IV dilaudid. Pain temporarily improved with each dose of dilaudid; however, relief did not last long.

Upon reassessment, patient does not feel that she can go home given the significant amount of pain and inability to ambulate or complete ADLs secondary to pain.

I reviewed findings relevant to this acute encounter with the patient along with plan of care as below:

#Acute on chronic cancer related pain
#Metastatic breast cancer with extensive lytic osseous involvement
Acute neck and back pain with significant progression over past 24 hours. CT spine shows lytic osseous metastases involving multilevel vertebra. Unable to independently walk or move neck thus admitting for ongoing pain mgmt and further work-up.

- Neurosurgery requesting full spine MRI w and w/o contrast and neck CTA
- Spoke with IP team. Will admit for pain mgmt and consult IR and radiation oncology
- Sending to ED given no availability for direct admission
- Palliative care referral placed; spoke with palliative care who recommended morphine 30 mg BID and methocarbamol 750 TID for OP management but will defer to IP team
- OP FHCC will get patient established with breast oncology

DISPOSITION

Patient discharged from ACE in stable condition and brought to ED.

FOLLOW UP

- Per IP recommendations

ATTESTATION

I spent 75 minutes on the care of this patient today including medical records review, assessment, diagnosis, management, documentation and care coordination with the patient's primary oncology team, neurosurgery, ED attending, IP team, and ACE team.

Temp: 36.5 °C

Pulse: 92

BP: (!) 134/91

Resp: 18

SpO2: 100%

?

Assessment and Plan:

Hand off: Yes APP handoff to ED attending

Discharge:
Patient tolerated treatment well and without complications.
Discharge disposition:
Accompanied by: Family
Discharged to: Emergency Room
Response: Aware of existing appointments, Aware of clinic contact information, States understanding of plan, Restates plan, and No further questions
Preferred language: English
Interpretation/Language Services: No Interpreter

Summary: Pt arrived via ambulation with spouse after getting mapping done in radiology. Reports severe 10/10 spasming of upper back and neck. Reports upper back has been ongoing but the neck is what started to get worse last night. Reports her neck and back is "seizing up and spasms". Reports chills. Denies fevers, SOB, chest pain, dizziness, changes in sensation, or weakness. Reports bowel and urination has remained normal. PIV 20G places, tolerated well, labs collected. CT full spine with contrast completed. Received IV Hydromorphone x3 with moderate effect but still very stiff and finding difficult to perform ADLs. Pt agreed to needing further workup for pain management. APP gave handoff to ED Attending. Pt stable and transferred via wheelchair by staff with partner to ED due to no bed availability per APP.

Additional documentation may exist in Flowsheets or Education Activity
