GENETIC TEST RESULT - Phone call

I called on 10/5/2026 and spoke with Yvonne Kalley Franklin to disclose the results of her recent germline (inherited) genetic testing.

Result: NEGATIVE. This test did not identify any pathogenic variants known to cause disease.

Lab: Invitae
Test: Hereditary Breast Cancer Guidelines-Based Panel (13 genes total)

Genes Analyzed: ATM*, BARD1, BRCA1, BRCA2, CDH1, CHEK2, NF1*, PALB2, PTEN*, RAD51C, RAD51D, STK11, TP53

This result has the following implications for Yvonne:

1. This is a normal result. The reason for Yvonne's personal history of breast cancer remains unknown. This negative result greatly reduces the likelihood of a genetic cause.

2. This result greatly reduces the likelihood of a cancer predisposition syndrome in Yvonne.

3. This result does not inform/change current recommendations for her cancer treatment.

4. We discussed that Yvonne's genetic testing only covered genes associated with breast cancer. There are several of the genes above that overlap with risks for ovarian, prostate, pancreatic, melanoma, and some other cancers. However, more cancer-related testing is available to her.Yvonne is aware up to 70 other cancer genes could be assessed for free by Invitae until March 3, 2027. Yvonne can contact me if she is interested. At this time, she is not interested in expanded testing.

5. No additional germline genetic testing is recommended for Yvonne at this time. She is recommended to follow-up with our genetics clinic in 3-5 years to see if additional genetic testing is available and/or recommended (scheduling # 206-606-6990).

6. Yvonne has the possibility of enrolling in clinical DNA biobanking for future genetic testing. Yvonne is eligible as an established patient at Fred Hutch based on her underlying diagnosis. There would be no extra charges for Yvonne to clinically bank their DNA. If Yvonne voices interest in the program, I will place a referral for them and coordinator will reach out to provide more information on the procedure, obtain consent, and schedule the blood sample collection. The coordinator can assist with answering Yvonne's questions.

1. Referral placed today.

This result has the following implications for Yvonne's relatives:

1. Yvonne's relatives are encouraged to share the family history of cancer(s) with their PCPs to help receive personalized recommendations for cancer screening. Yvonne is encouraged to share a copy of her testing report with her relatives as well.

2. Genetic testing is NOT recommended for Yvonne's relatives who are unaffected (ie. No cancer histories) since we did not identify a clear genetic cause for Yvonne's cancer.

3. Yvonne's close female relatives, such as her daughter and mother, are encouraged to talk with their doctors about increased breast cancer surveillance (starting at age 37) based on the family history. The National Comprehensive Cancer Network (NCCN) recommends that for individuals at greater than 20 percent average

lifetime risk of invasive breast cancer, screening recommendations include:

1. Clinical breast exams: Every 6 to 12 months starting 10 years younger than the youngest breast cancer case in the family;
2. Mammograms: Every year starting 10 years younger than the youngest breast cancer case in the family; and
3. Breast MRIs: Every year starting 10 years younger than the youngest breast cancer case in the family.

All of Yvonne's questions were answered over the phone today. I will send a copy of this summary letter and the genetic testing result to Yvonne. She may contact our clinic if questions about the results arise in the future.
